

Practical No. 1

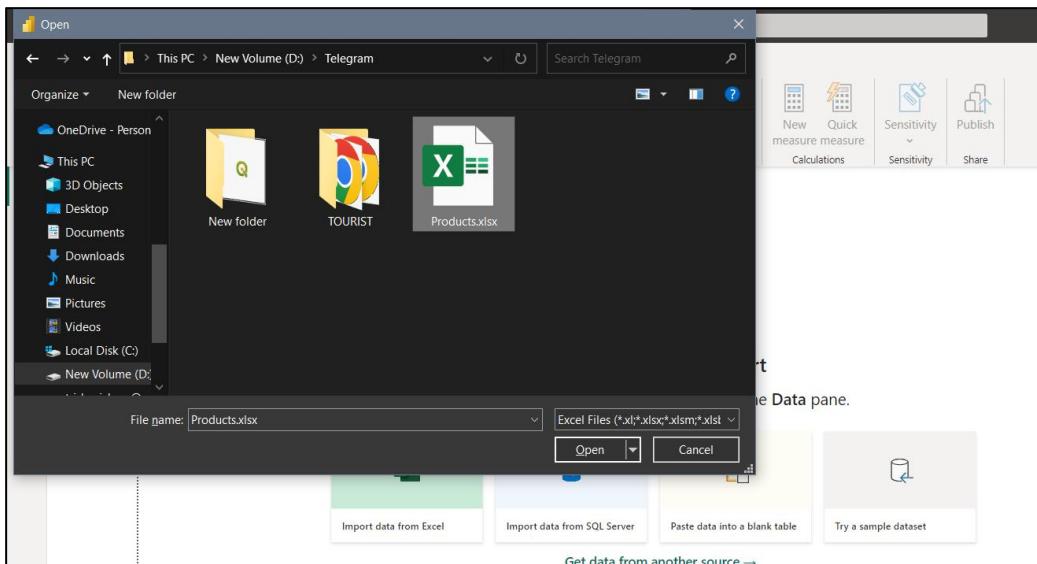

Aim: Import the legacy data from different sources such as (Excel, SQL Server, Oracle etc.) and load in the target system.

Importing Excel Data

- 1) Launch Power BI Desktop.
- 2) From the Home ribbon, select Get Data. Excel is one of the Most Common data connections, so you can select it directly from the Get Data menu.

- 3) In the Open File dialog box, select the Products.xlsx file.

- 4) In the Navigator pane, select the Products table and then select Edit.

ProductID	ProductName	SupplierID	CategoryID	Quantity
1	Chai	1	1	10

Importing Data from OData Feed

Step 1: - Download data of North wind ODATA feed from: -

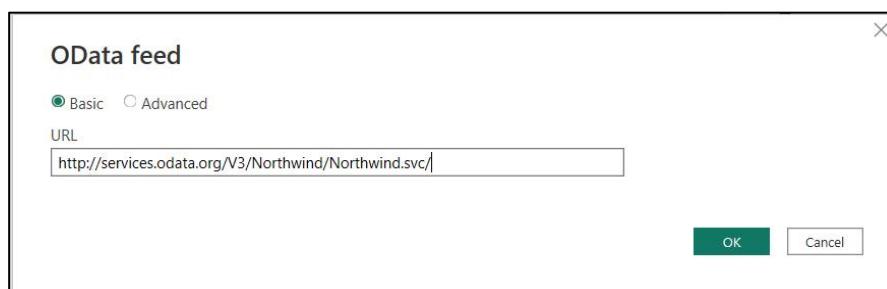

<http://services.odata.org/V3/Northwind/Northwind.svc/>

Connect to an OData feed:

- 1) From the Home ribbon tab in Query Editor, select Get Data.
- 2) Browse to the OData Feed data source.

- 3) In the OData Feed dialog box, paste the URL for the North wind OData feed.

- 4) Select OK.
- 5) In the Navigator pane, select the Orders table, and then select Edit.

Table: Alphabetical_list_of_products (69 rows)

Practical No. 2

Aim: - Perform the Extraction Transformation and Loading (ETL) process to construct the database in the SQL server / Power BI.

A: Data Extraction:

The data extraction is first step of BTL, there are 2 Types of Data Extraction

- 1) Pull Extraction: « All the data from source systems or operational systems gets extracted to staging area. (Initial Load)
- 2) Partial Extraction: - Sometimes we get notification from the source system to update specific date. It is called as Delta load.

Source System Performance: The Extraction strategies should not affect source system performance.

B: Data Transformation:

The data transformation is second step. After extracting the data there is big need to do the transformation as per the target system. Some bullet points of Data Transformation,

- Data Extracted from source system is in to raw format, we need to transform it before loading in to target server.
- Data has to be cleaned, mapped and transformed
- There are following important steps of Data Transformation: -
 - Selection: Select data to load i in target
 - Matching: Match the data with target system
 - Data Transforming: We need to change data as per target table structures

Real life examples of Data Transformation: -

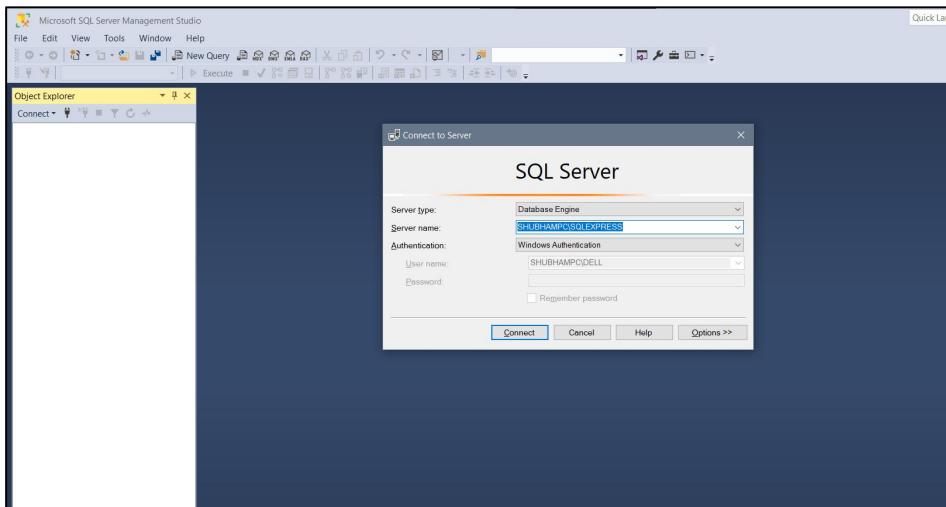

- Standardizing data: - Data is fetched from multiple sources so it needs to be standardized as per the target system.
- Character set conversion: - Need to transform the character sets as per the target systems. (First name and last name example)
- Calculated and derived values: In source system there is first value and second value and in target we need the calculation of first value and second value.
- Data Conversion in different formats: - If in source system date in in DDMMYY format and in target the date is in DDMONYYYY format then this transformation needs to be done at transformation phase.

C: Data Loading:

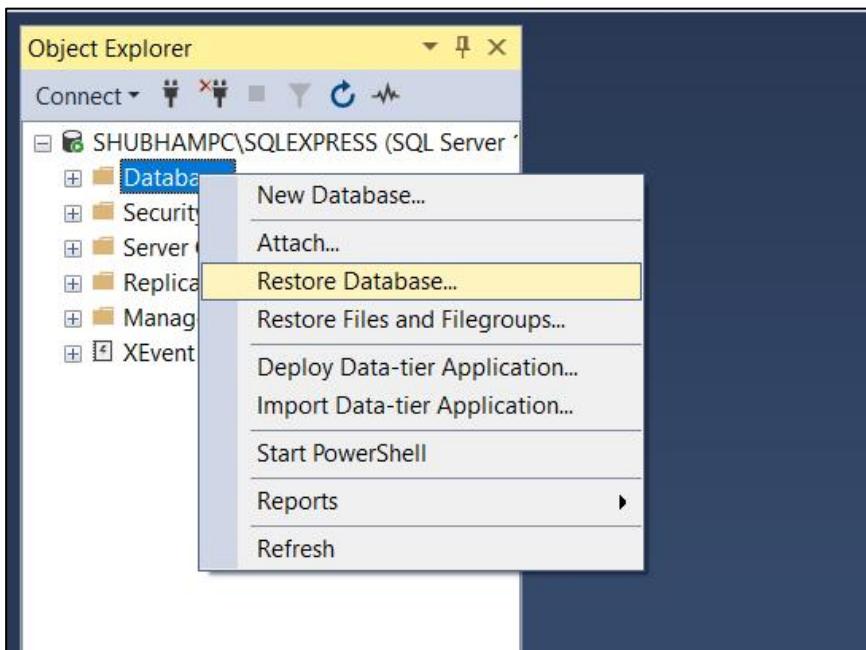

Data loading phase loads the prepared data from staging tables to main tables.

ETL process in SQL Server:

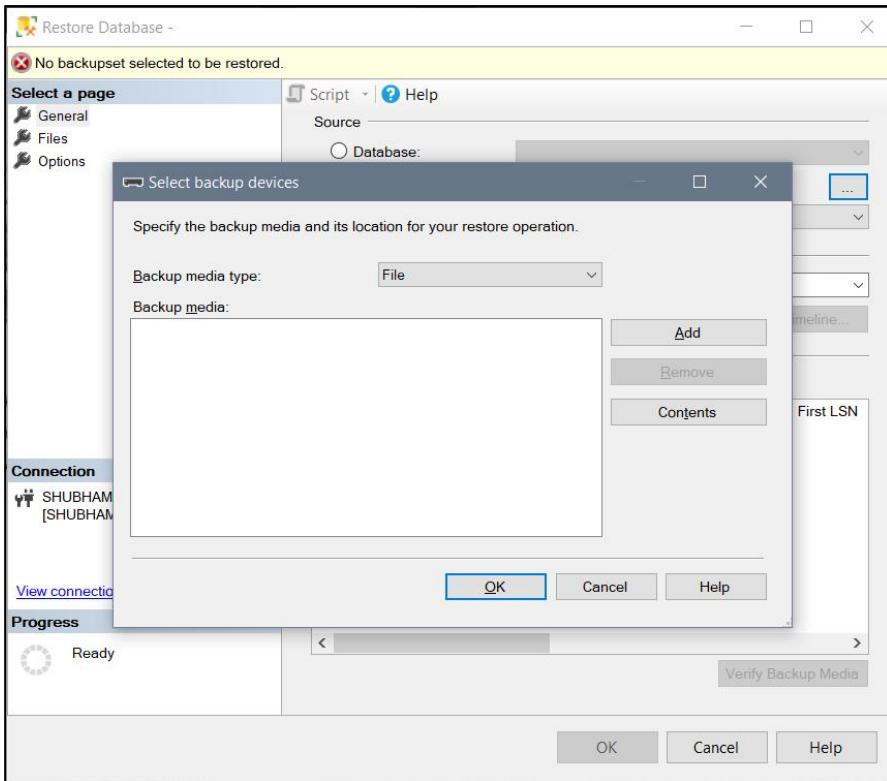

Step 1: Open SQL Server Management Studio to restore backup file

Step 2: Right click on Databases → Restore Database

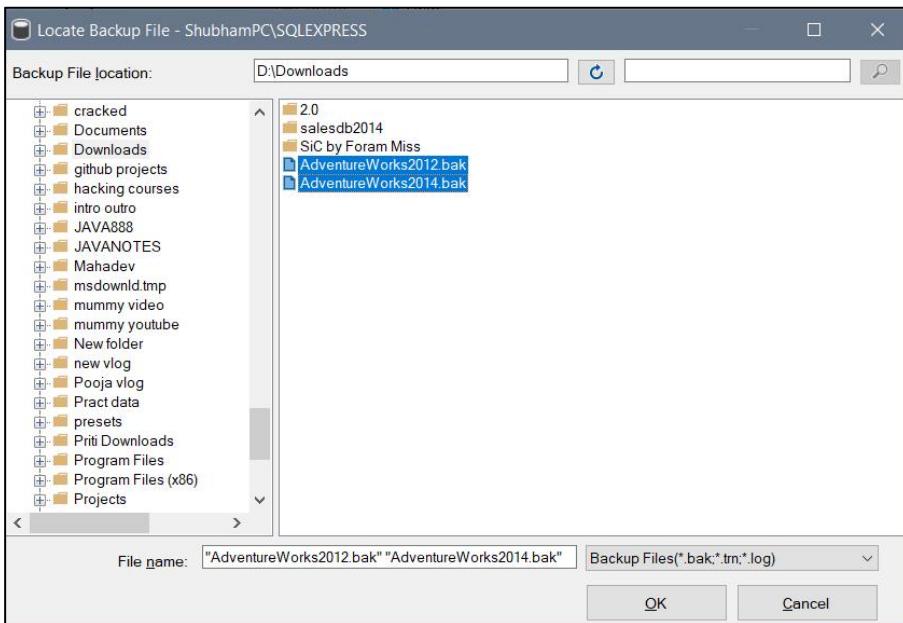

Step 3: Select Device → click on icon towards end of device box

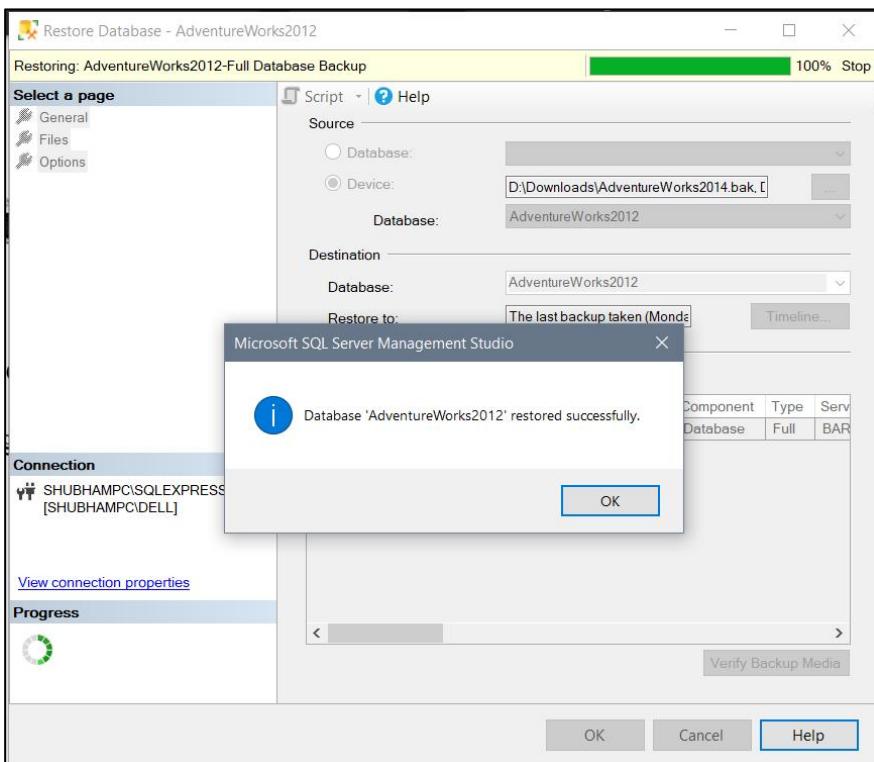

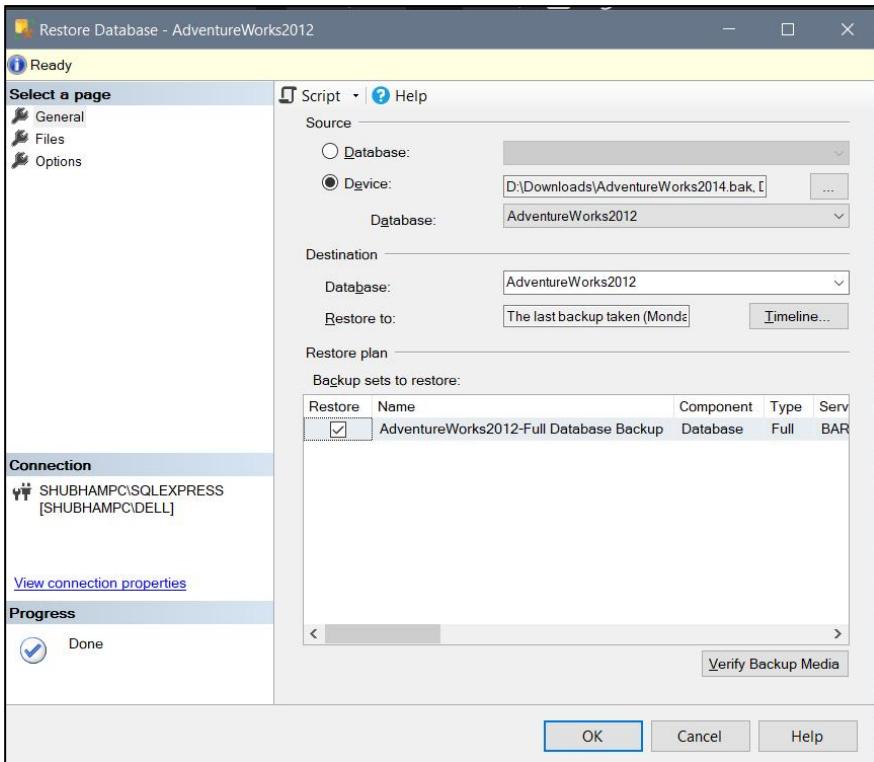

Step 4: Click on add → Select path of backup files

Step 5: Select both files at a time.

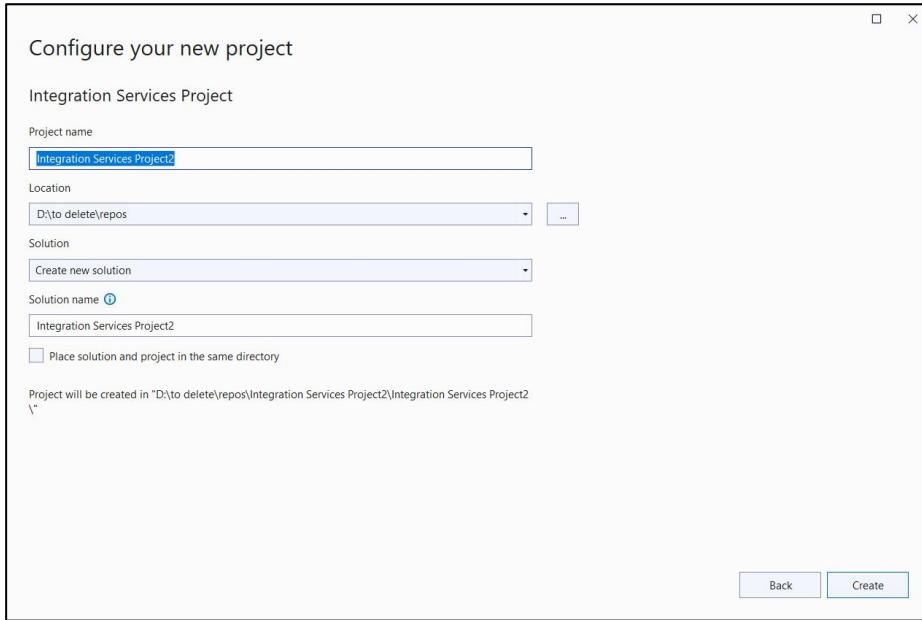

Step 6: Click ok and in select backup devices window Add both files of Adventure Works.

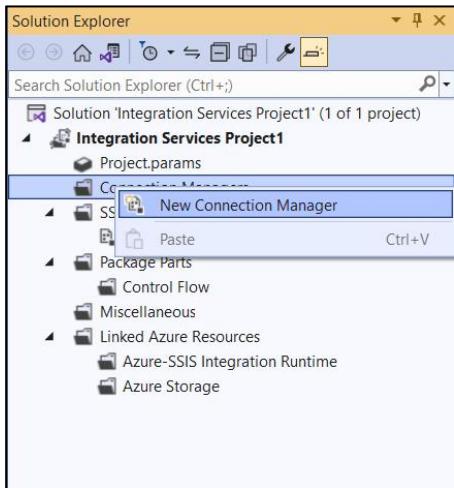

Step 7: Open SQL Server Data Tools

Select File new Project → Business Intelligence → Integration Services - Project & give appropriate project name.

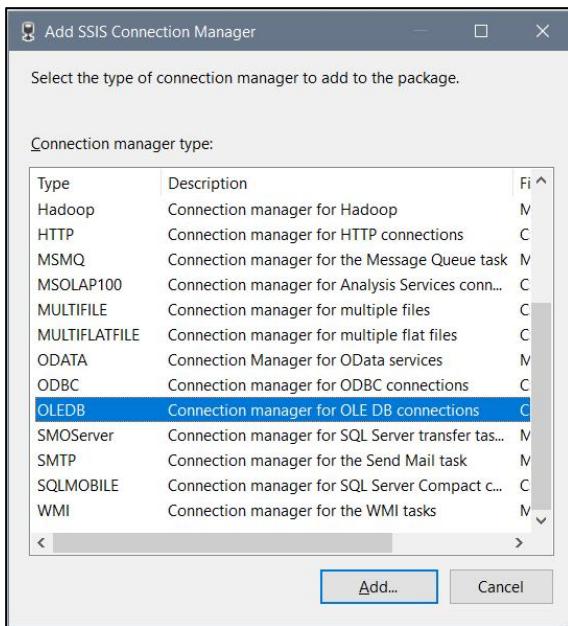

Step 8: Right click on Connection Managers in solution explorer and click on New Connection Manager.

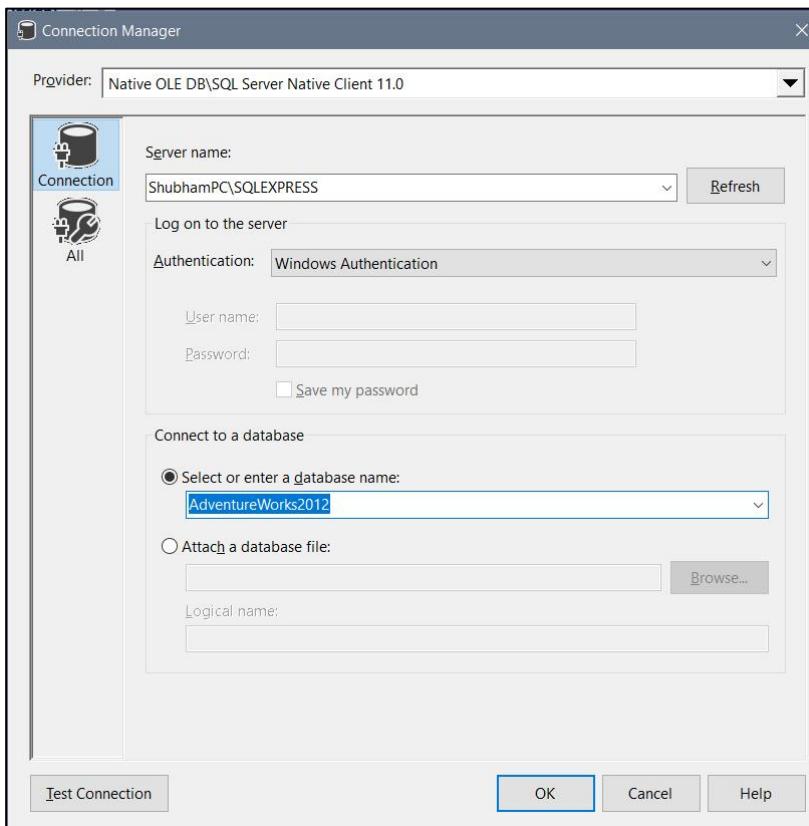

Add SSIS connection manager window appears.

Step 9: Select OLEDB Connection Manager and click on Add.

Step 10: Configure OLE DB Connection Manager Window appears → Click on New

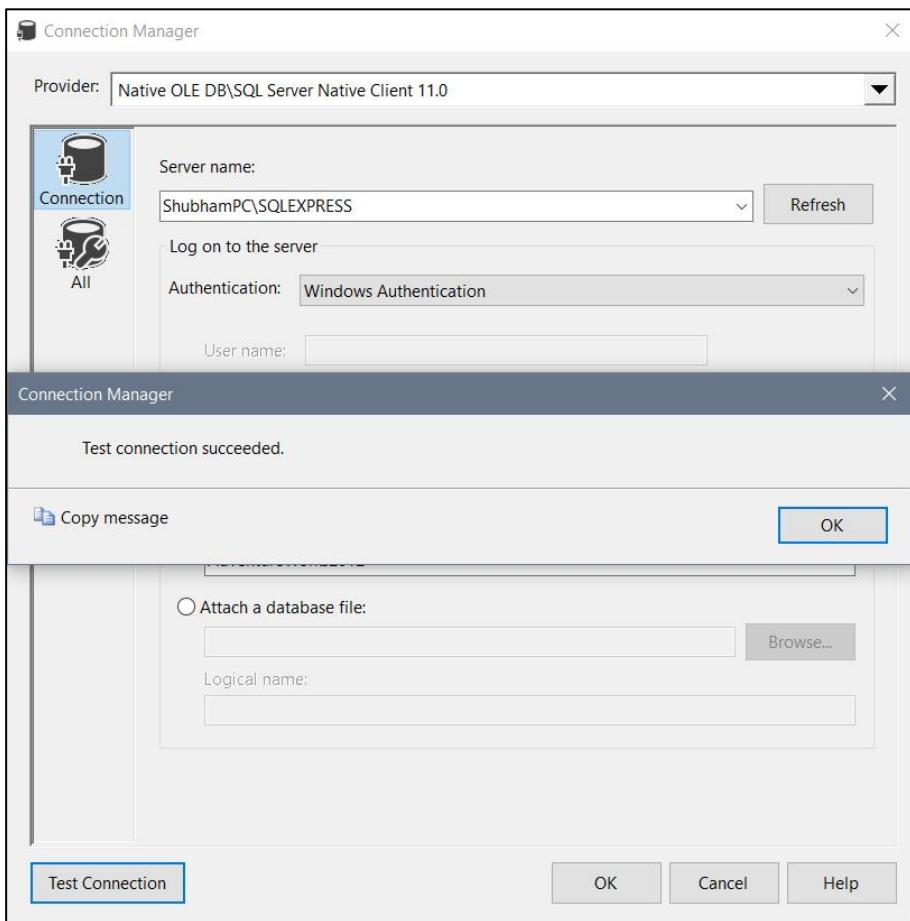

Step 11: Select Server name (as per your machine) from drop down and database name and click on Test connection.

Step 12: If test connection succeeded

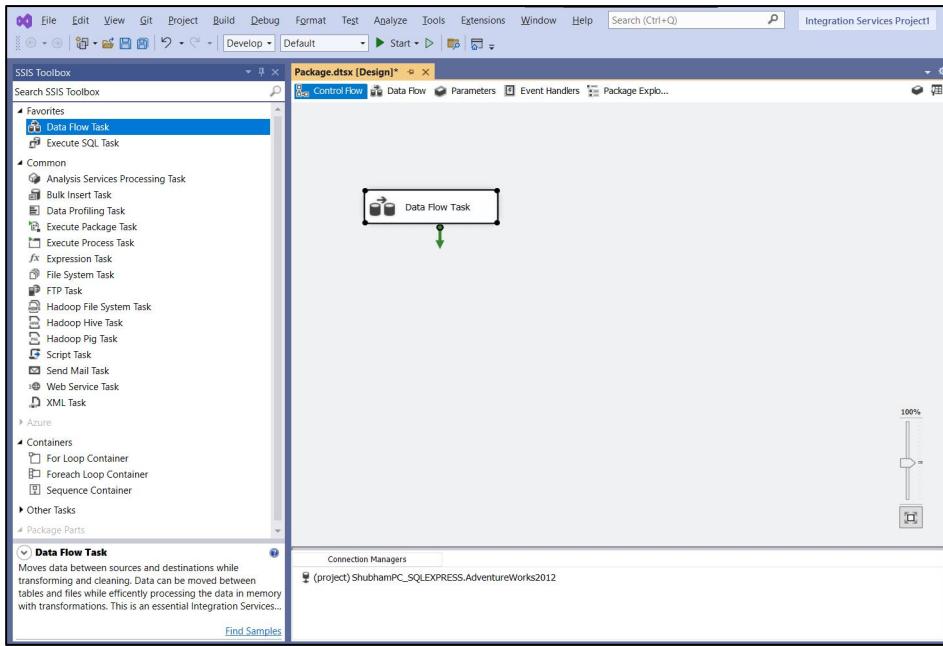

click on OK.

Step 13: Click on OK

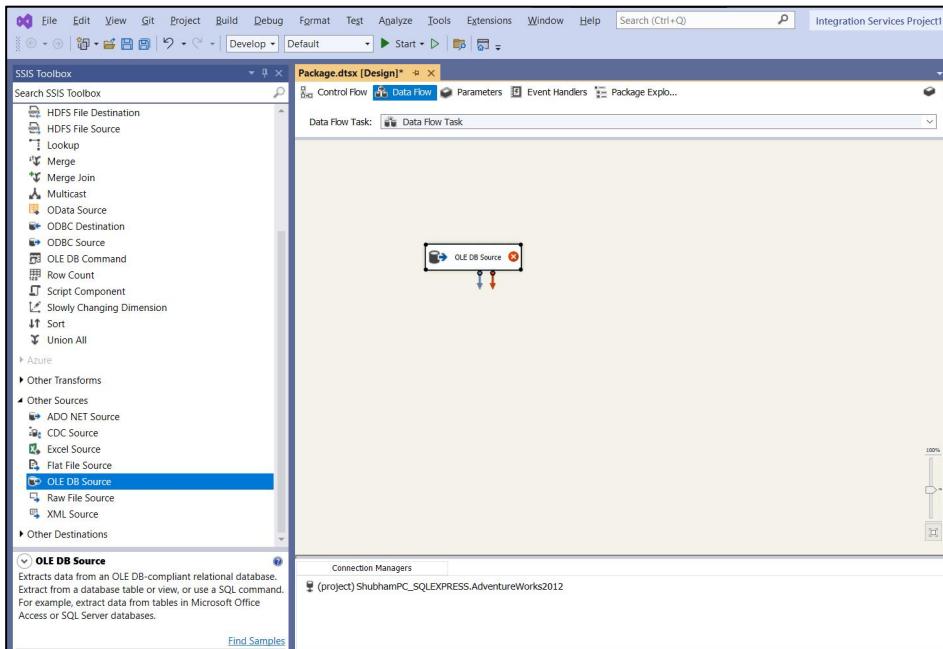

Connection is added to connection manager.

Step 14: Drag and drop Data Flow Task in Control Flow tab.

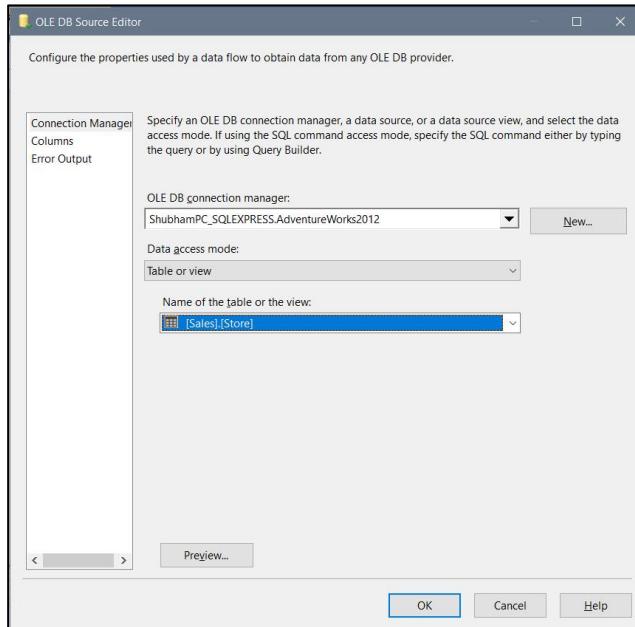

Step 15: Drag OLE DB Source from other sources and drop into data flow tab.

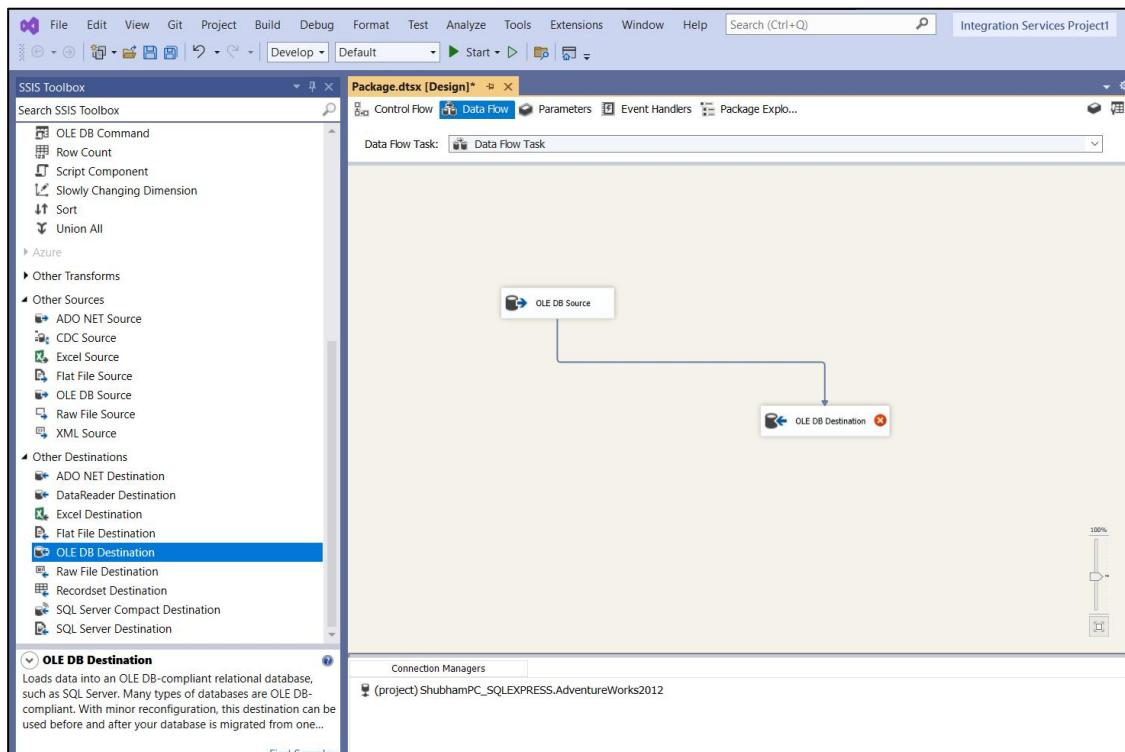

Step 16: Double click on OLE DB source → OLE DB Source Editor appears → click on New to add connection manager.

Select [Sales].[Store] table from drop down → ok.

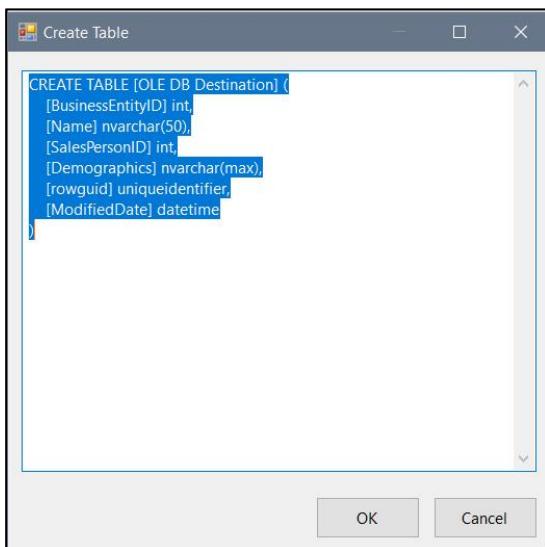

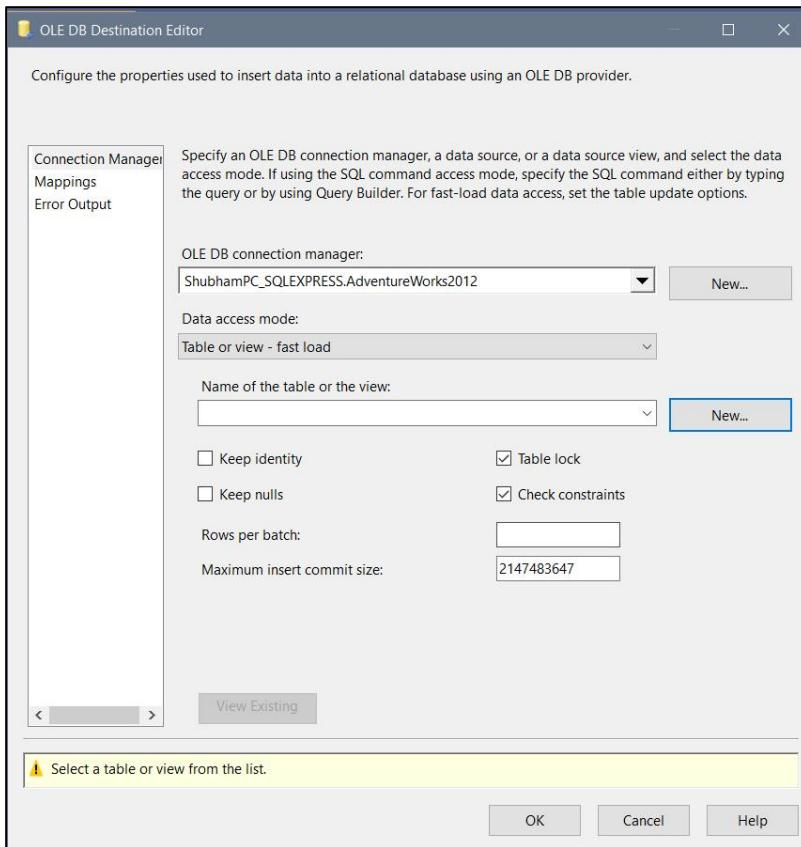

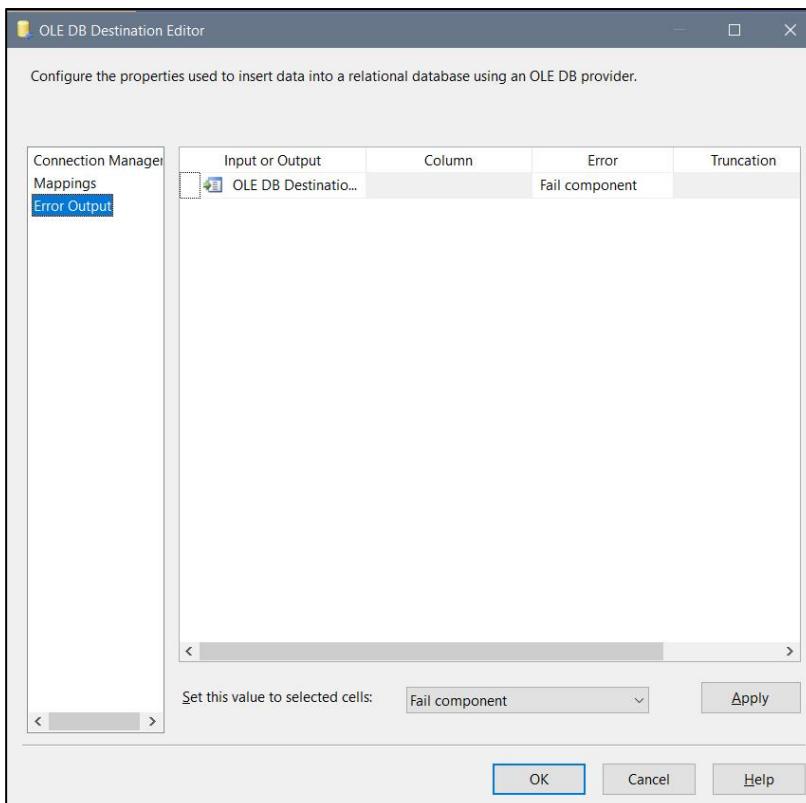

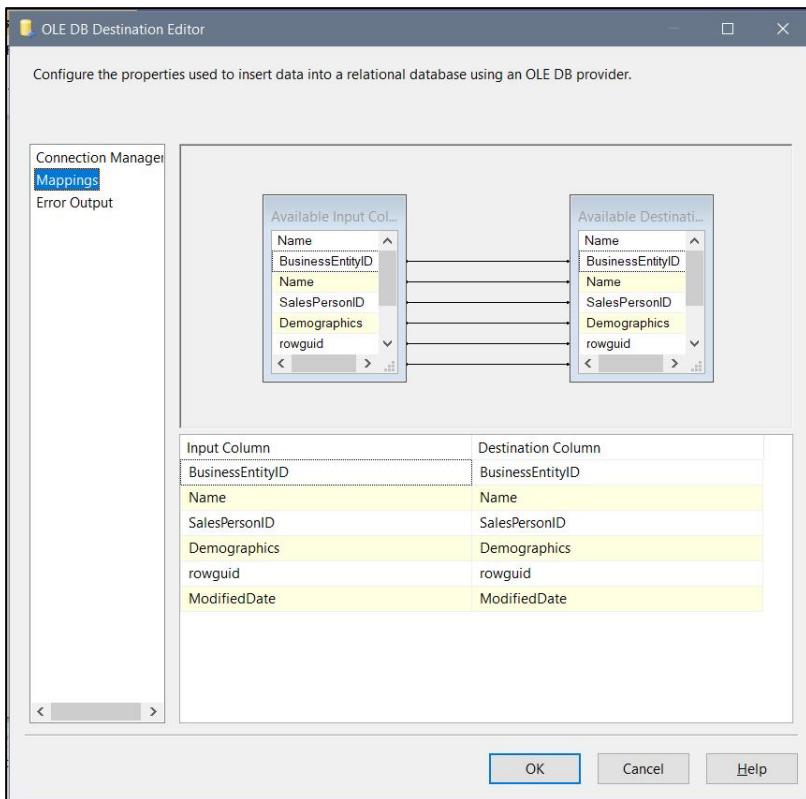

Step 17: Drag OLEDB destination in data flow tab and connect both.

Step 18: Double click on OLE DB destination.

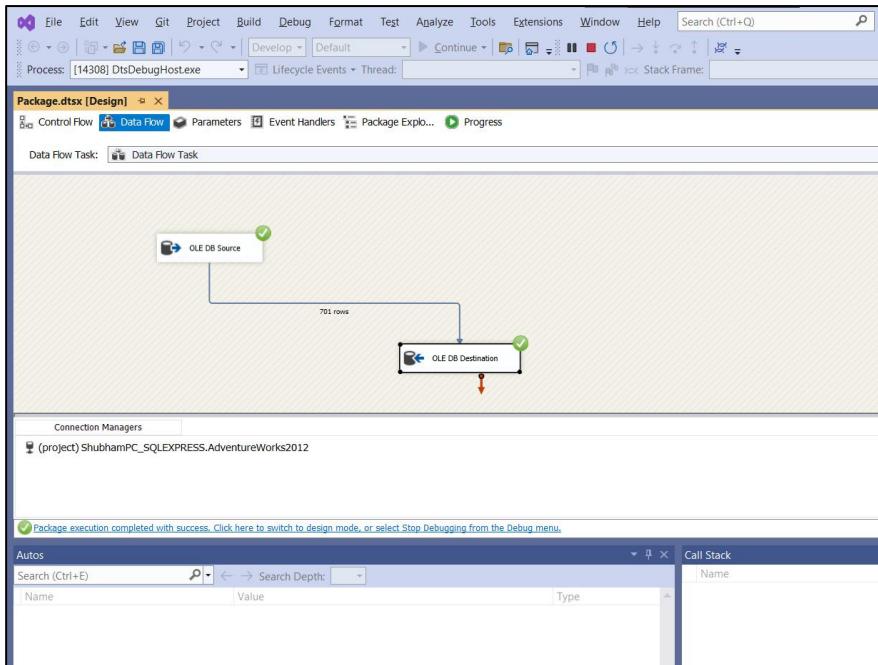

Step 19: Click on New to run the query to get [OLE DB Destination] in Name of the table or the view.

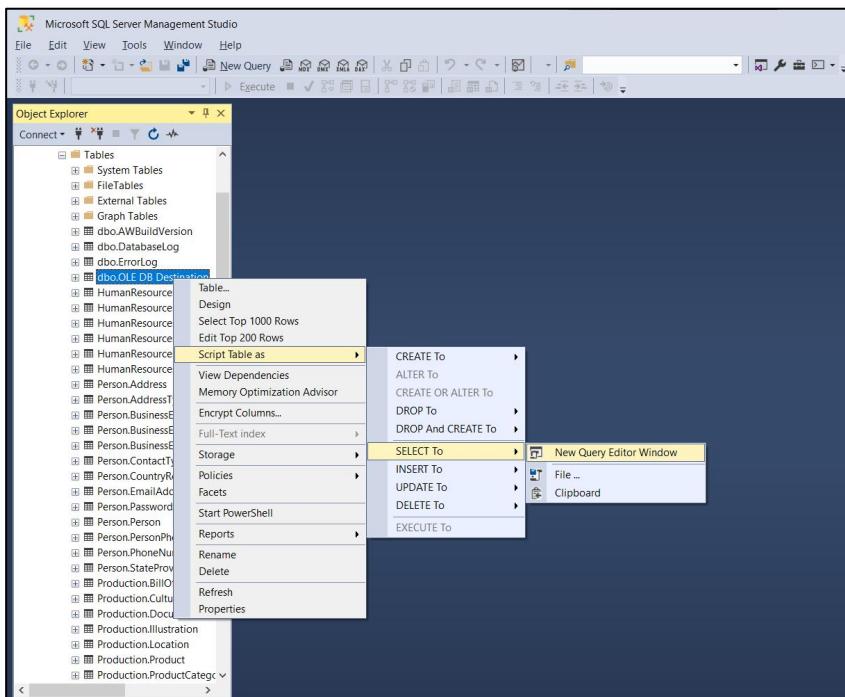

Click On OK.

Step 20: Click on Start.

Step 21: Go to SQL Server Management Studio.

In database tab → Adventure works → Right click on [dbo].[OLE DB Destination] Script Table as → SELECT To New Query Editor Window.

Step 22: Execute following query to get output.

USE [AdventureWorks2012]

GO

SELECT[BusinessEntityID]

,[Name]

,[SalesPersonID]

,[Demographics]

,[rowguid]

,[ModifiedDate]

FROM [dbo].[OLE DB Destination]

GO

The screenshot shows the Microsoft SQL Server Management Studio interface. The title bar reads "SQLQuery1.sql - SHUBHAMPC\SQLEXPRESS.AdventureWorks2012 (SHUBHAMPC\DELL (70)) - Microsoft SQL Server Management Studio". The main window displays a T-SQL script in the center pane:

```
USE [AdventureWorks2012]
GO

SELECT [BusinessEntityID]
      ,[Name]
      ,[SalesPersonID]
      ,[Demographics]
      ,[rowguid]
      ,[ModifiedDate]
  FROM [dbo].[OLE DB Destination]
```

Below the script, the results pane shows a table with 17 rows of data. The columns are:

BusinessEntityID	Name	SalesPersonID	Demographics	rowguid	ModifiedDate

Practical No. 3

Aim: Create the cube with suitable dimension and fact tables based on OLAP.

Step 1: Creating Data Warehouse

Let us execute our T-SQL Script to create data warehouse with fact tables, dimensions and populate them with appropriate test values.

Download T-SQL script attached with this article for creation of Sales Data Warehouse or download from this article "Create First Data Warehouse" and run in your SQL Server. Downloading "Data Warehouse SQLScript.zip" from the article.

<https://www.codeproject.com/Articles/652108/Create-First-Data-WareHouse>

After downloading extract file in folder.

Follow the given steps to run the query in SSMS (SQL Server Management Studio).

Open SQL Server Management Studio 2012

Connect Database Engine

Password for sa: admin123 (as given during installation)

Click Connect.

Open New Query editor

4. Copy paste Scripts given below in various steps in new query editor window one by one

5. To run the given SQL Script, press F5

6. It will create and populate "Sales DW" database on your SQL Server

OR

1. Go to the extracted SQL file and double click on it.

2. New SQL Query Editor will be opened containing Sales DW Database.

```

--DROP DATABASE Sales_DW
GO
Create database Sales_DW
Go

Use Sales_DW
Go

--Create Customer dimension table in Data Warehouse which will hold customer personal details.

Create table DimCustomer
(
    CustomerID int primary key identity,
    CustomerAltID varchar(10) not null,
    CustomerName varchar(50),
    Gender varchar(20)
)
go

```

Step 2: Start SSDT environment and create New Data Source.

Go to SQL Server Data Tools → Right click and run as administrator

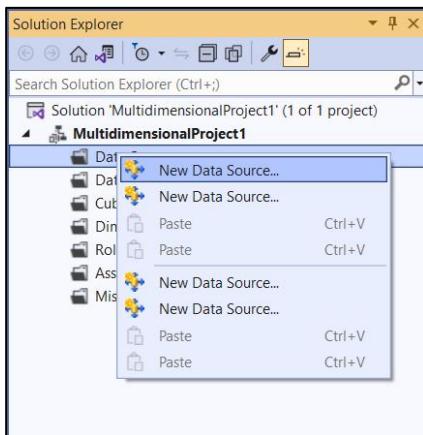

Click on File → New Project

In Business Intelligence → Analysis Services Multidimensional Project → appropriate project name → click OK.

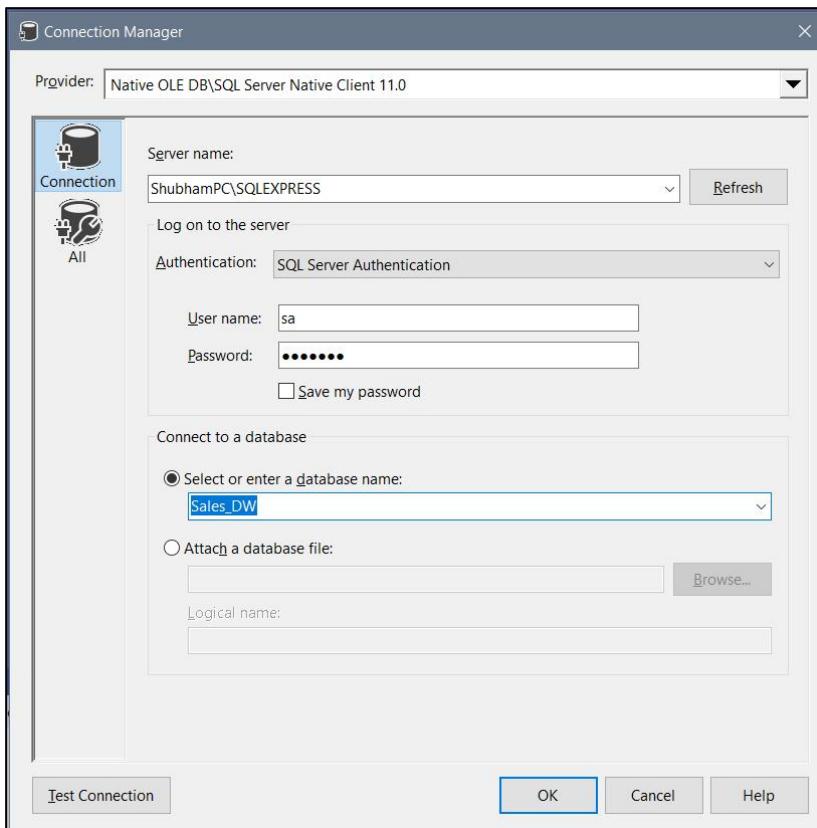

Right click on Data Sources in solution explorer → New Data Source.

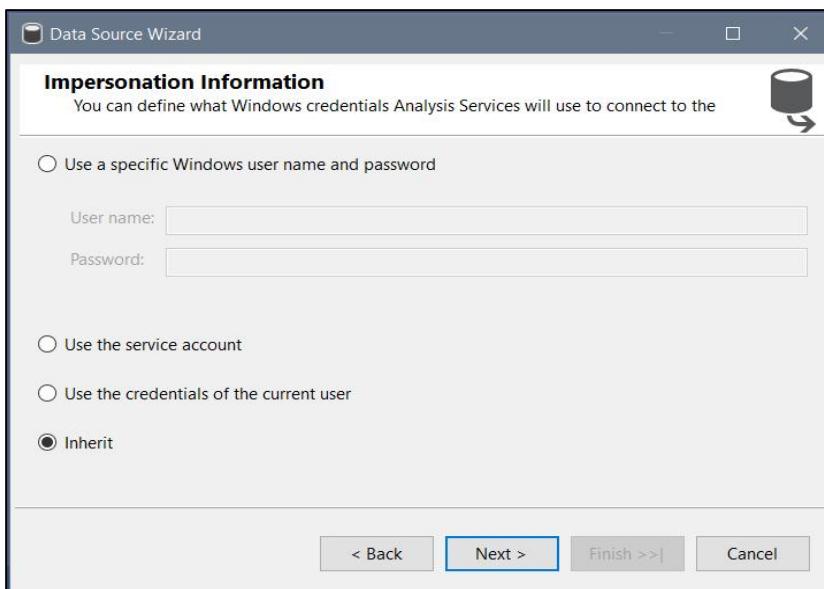

Select Server → Name select Use SQL Server Authentication → Select or enter a database name (Sales DW).

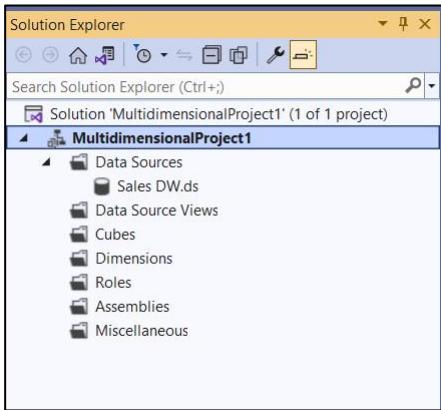

Click Next

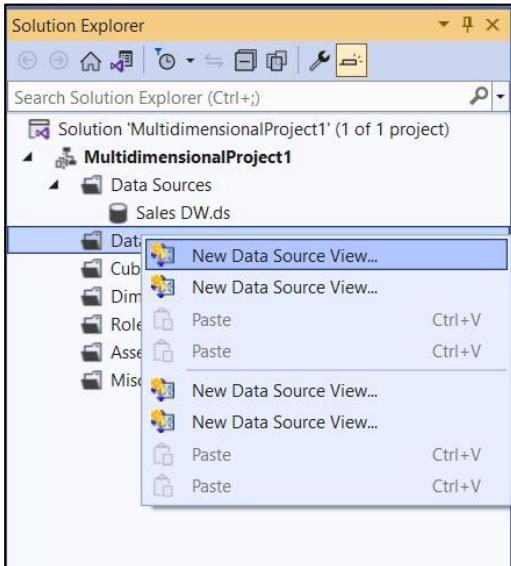

Select Inherit → Next

Sales_DW.ds gets created under Data Sources in Solution Explorer

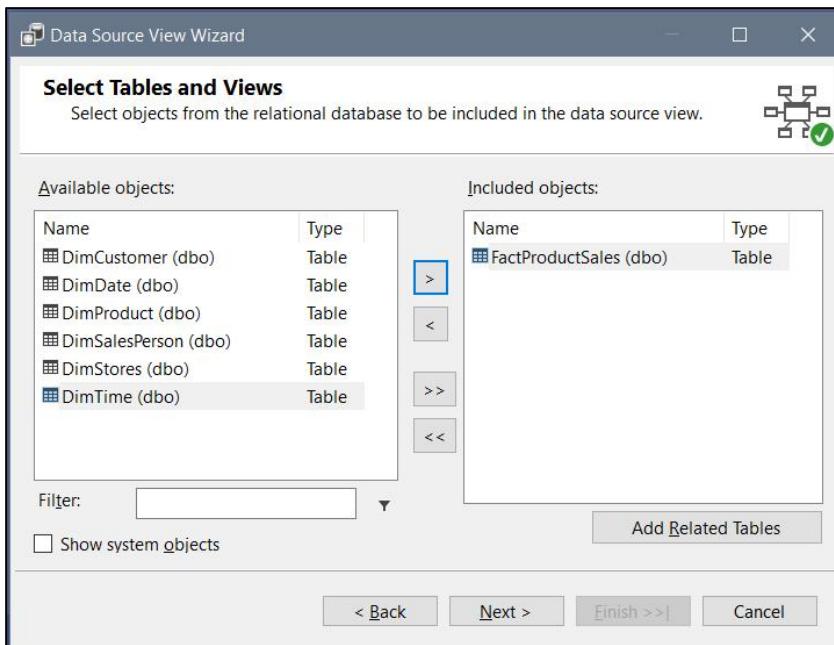

Step 3: Creating New Data Source View in Solution explorer right click on Data Source View
Select New Data Source View

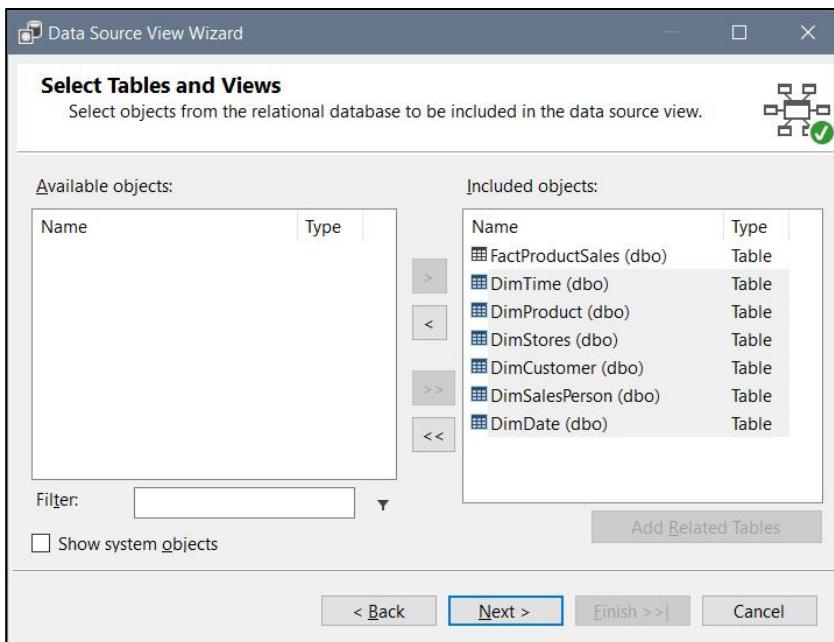

Click Next

Select FactProductSales(dbo) from Available objects and put in Includes Objects by clicking on

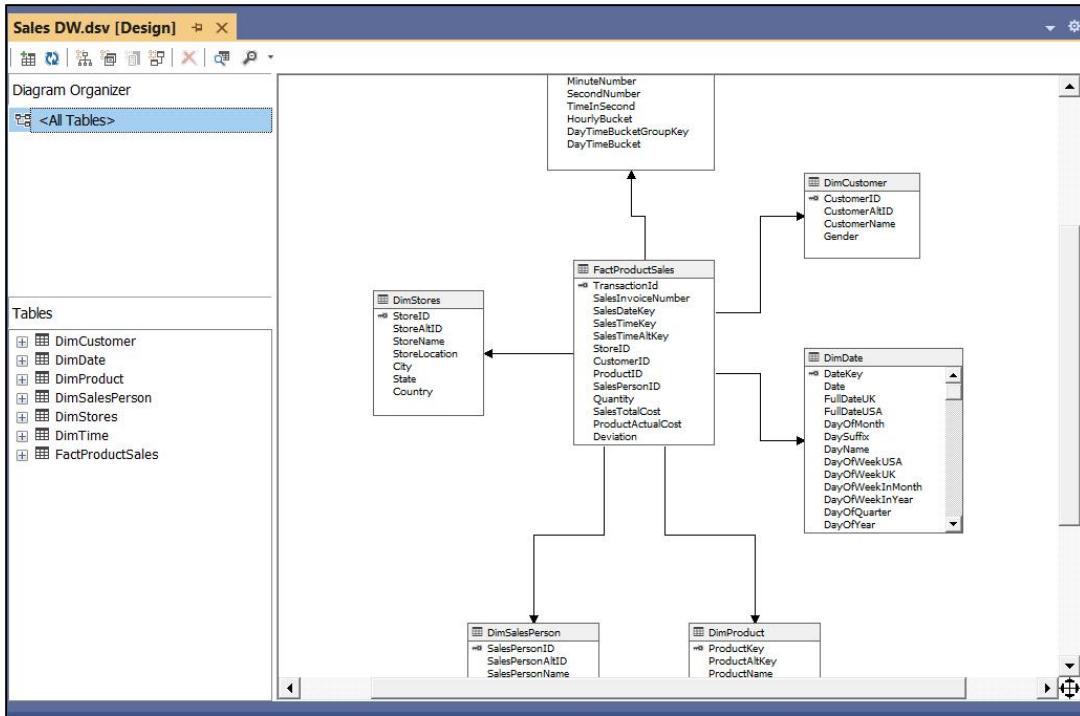

Click on Add Related Tables

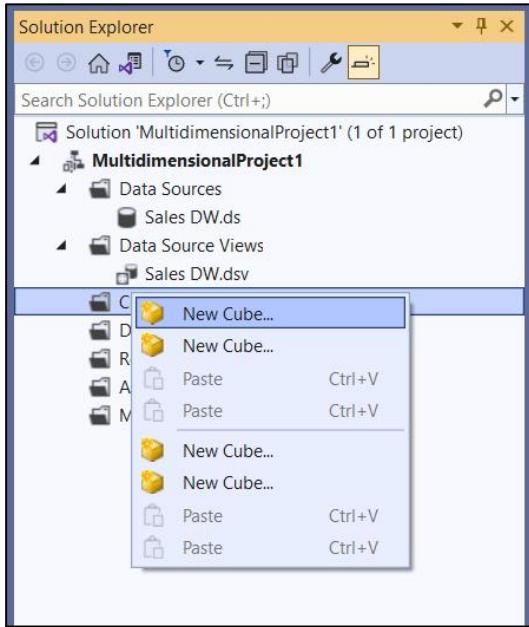

Click Finish

Sales DW.dsv appears in Data Source Views in Solution Explorer.

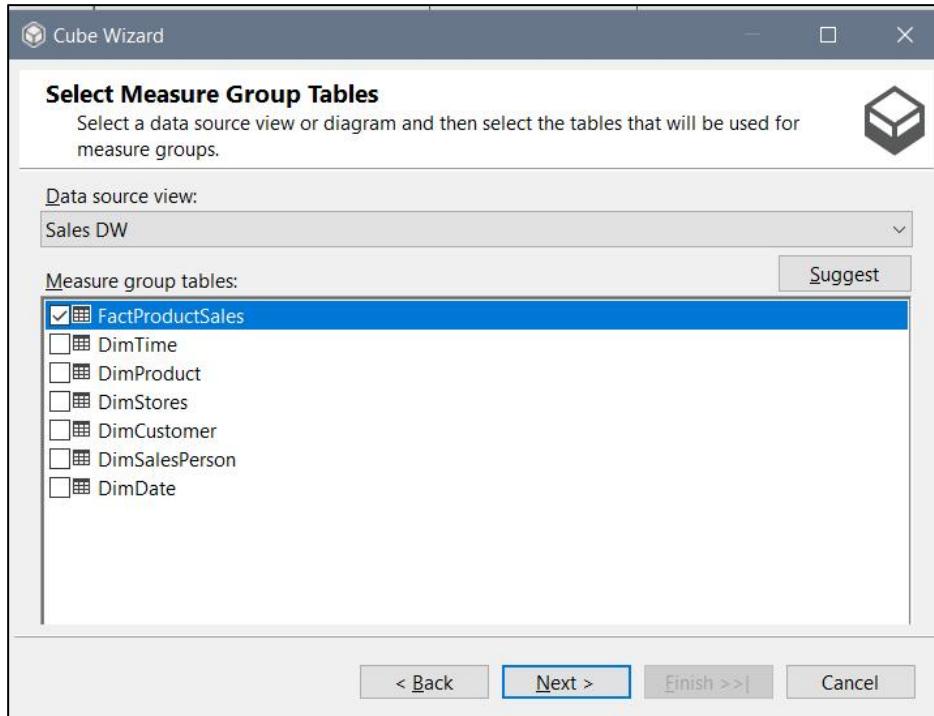

Step 4: Creating new cube

Right click on cubes → New Cube

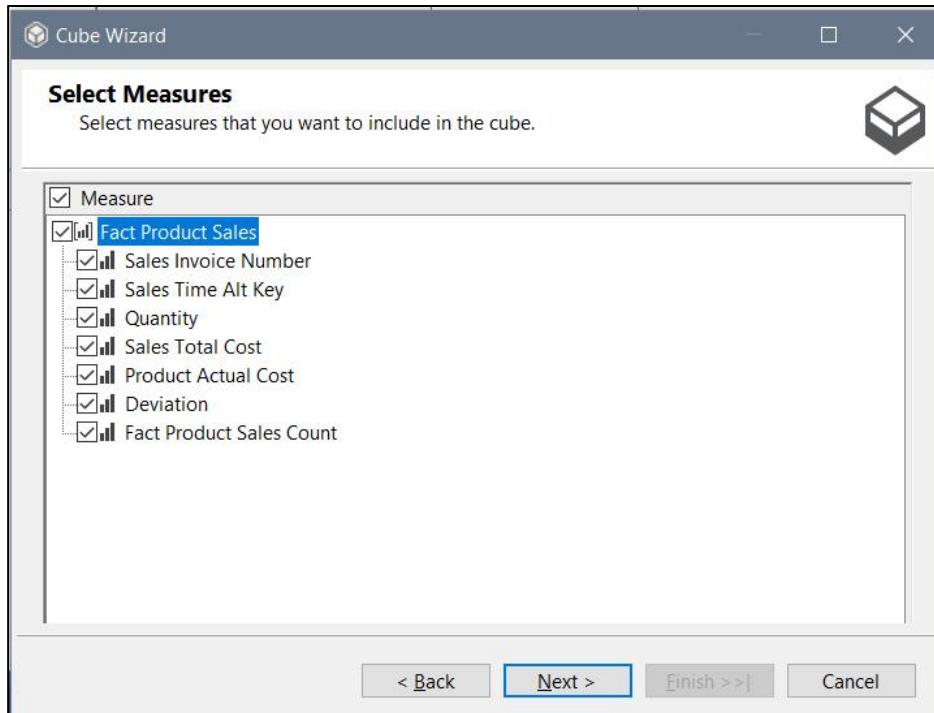

Select Use existing tables in Select Creation Method → Next

In Select Measure Group Tables → Select FactProductSales → Click Next

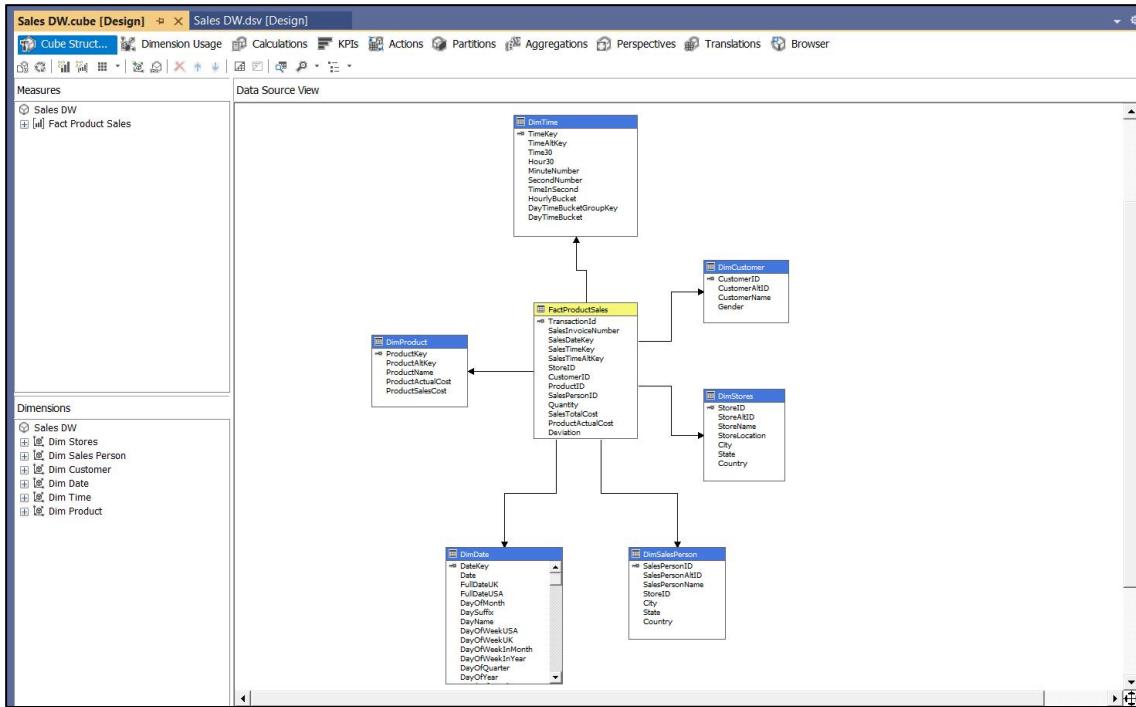

In Select Measures → check all measures → Next

In Select New Dimensions → Check all Dimensions → Next.

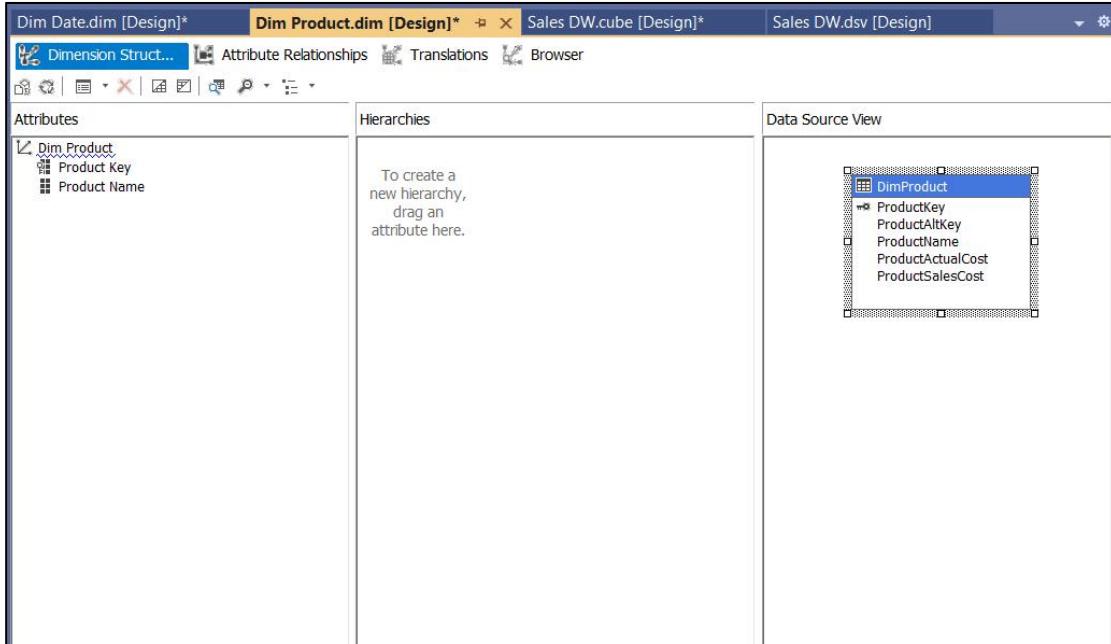

Click on Finish.

Sales_DW.cube is created.

Step 5: Dimension Modification In dimension tab → Double Click Dim Product.dim

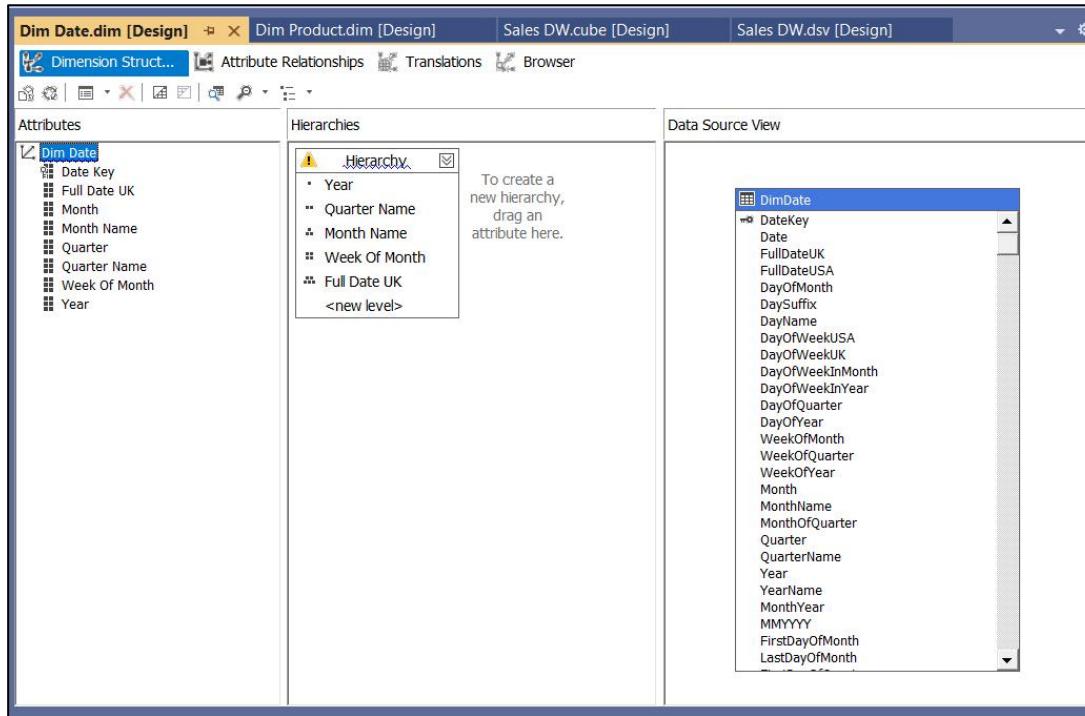

Step 6: Drag and Drop Product Name from Table in Data Source View and Add in Attribute Pane at left side.

Step 7: Creating Attribute Hierarchy in Date Dimension.

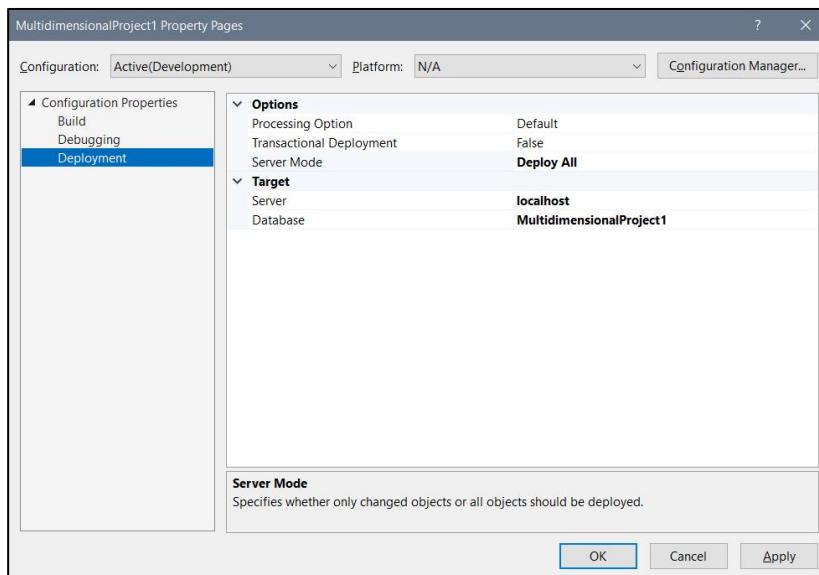

Double click on Dim Date dimension → Drag and Drop Fields from Table shown in Data Source View to Attributes → Drag and Drop attributes from leftmost pane of attributes to middle pane of Hierarchy.

Drag fields in sequence from Attributes to Hierarchy window (Year, Quarter Name, Month, Name, Week of the Month, Full Date UK).

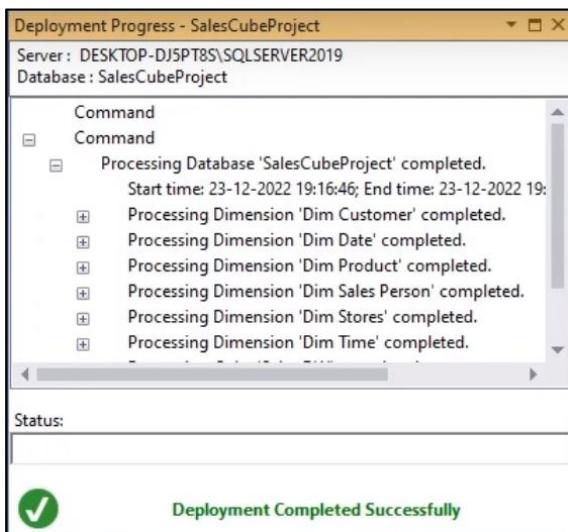

Step 8: Deploy Cube Right click on Project name → Properties

Do following changes and click on Apply & OK.

Right click on project name → Deploy.

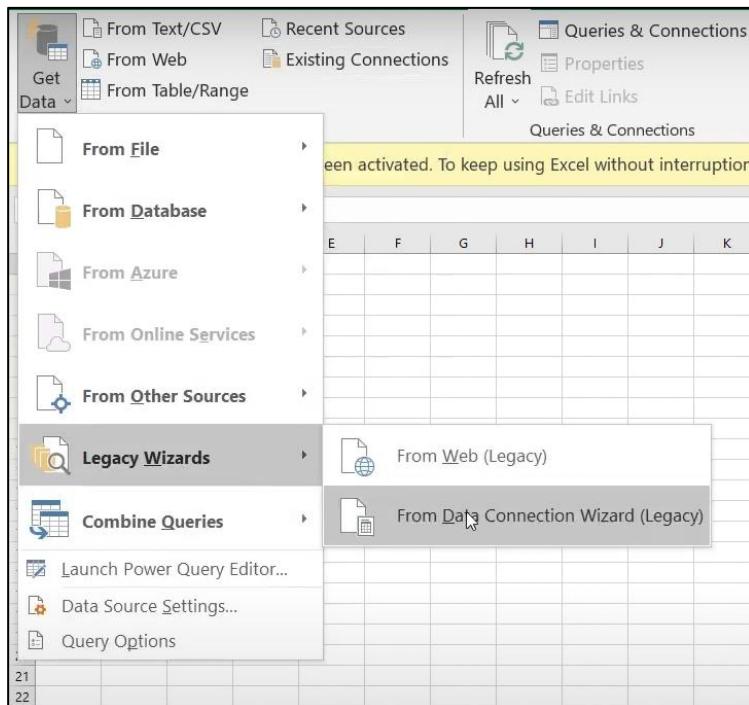

Practical No. 4

A) Aim: Import the data warehouse data in Microsoft Excel and create the Pivot table and Pivot Chart

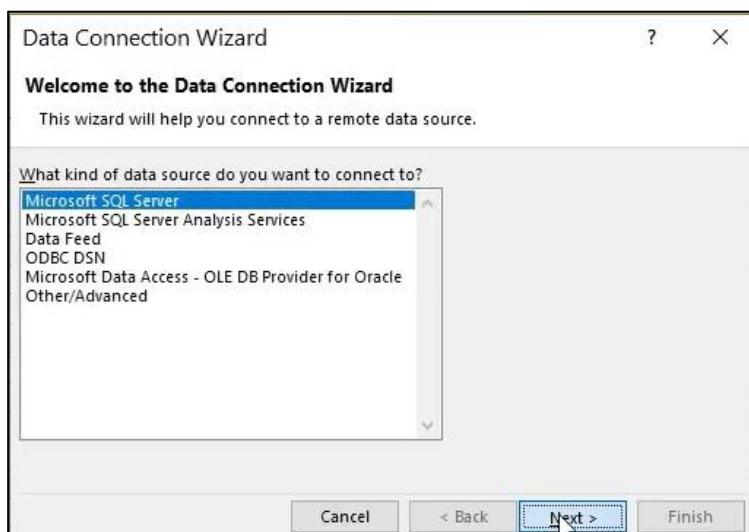

(MS Office Professional is used to make sure Power View is enabled for visualization.)

Step 1: Open Excel 2013 (Professional)

Go to Data tab → Get External Data → From Other Sources → From Data Connection Wizard

Step 2: In Data Connection Wizard → Select Microsoft SQL Server → Click on next

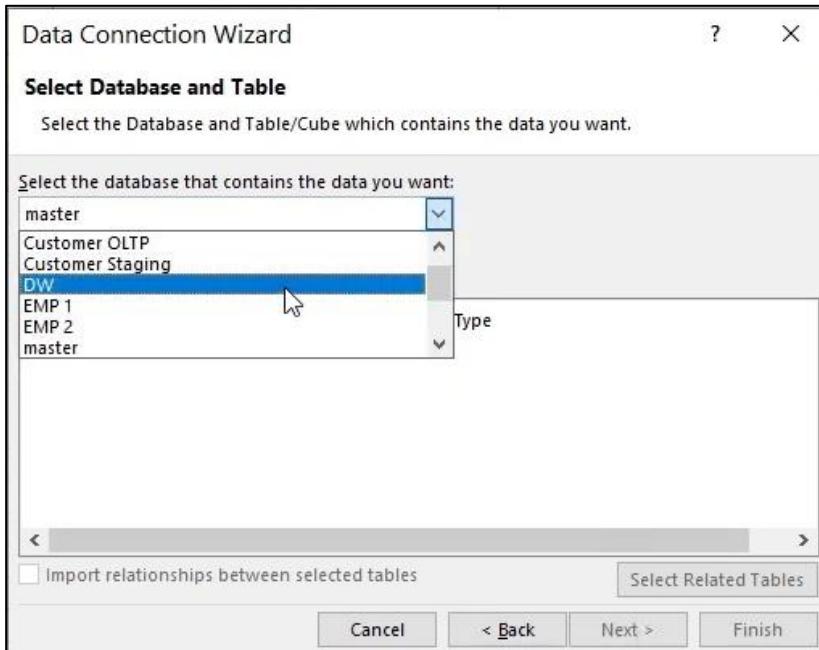

Step 3: In connect to Database Server provide Server name (Microsoft SQL Server Name)

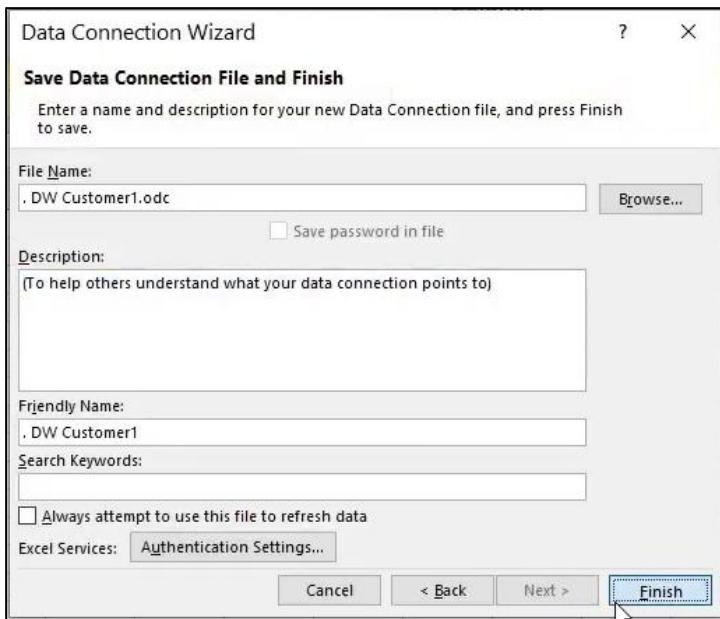

Click on OK

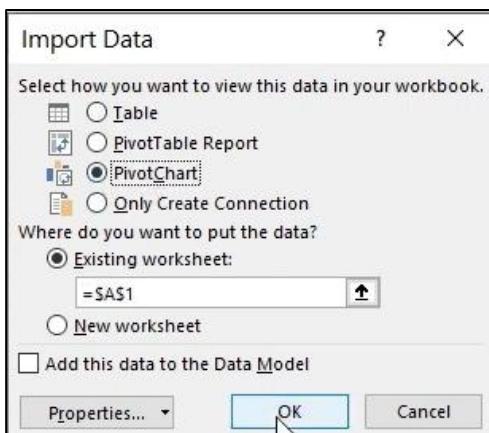

Step 4: In Select Database and Table Select → Sales_DW (already created in SQL) → check all dimensions and import relationships between selected tables

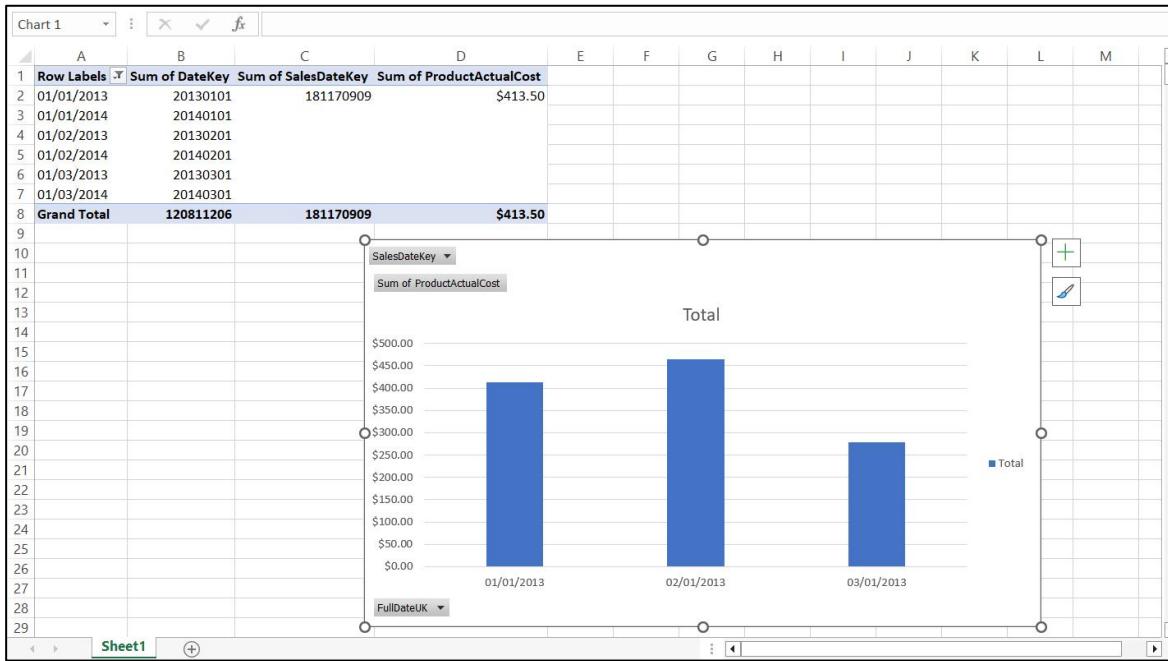

Step 5: In save data connection files browse path and click on Finish

Step 6: In import data select Pivot Chart and click on OK

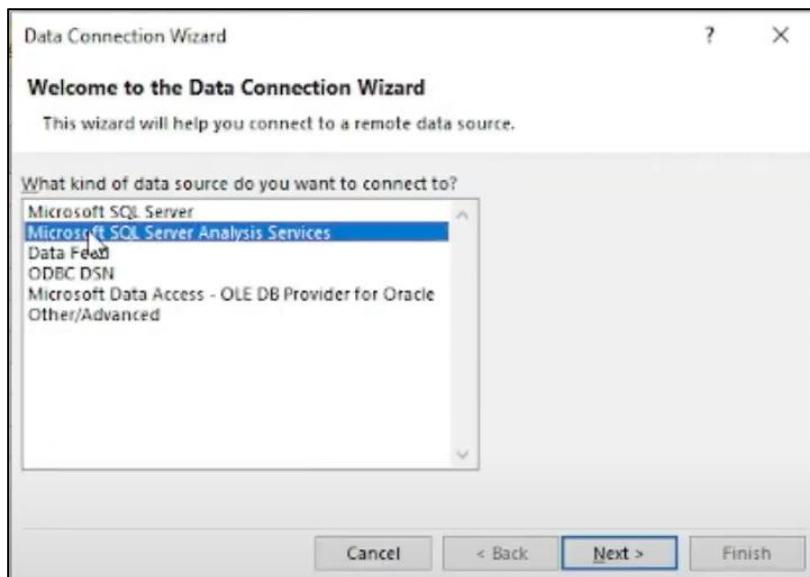

Step 7: In fields put SalesDateKey in filters, FullDateUK in axis and Sum of ProductActualCost in values

B) Aim: -Import the cube in Microsoft Excel and create the Pivot table and Pivot Chart to perform data analysis.

Step 1: Open Excel 2013 (Professional)

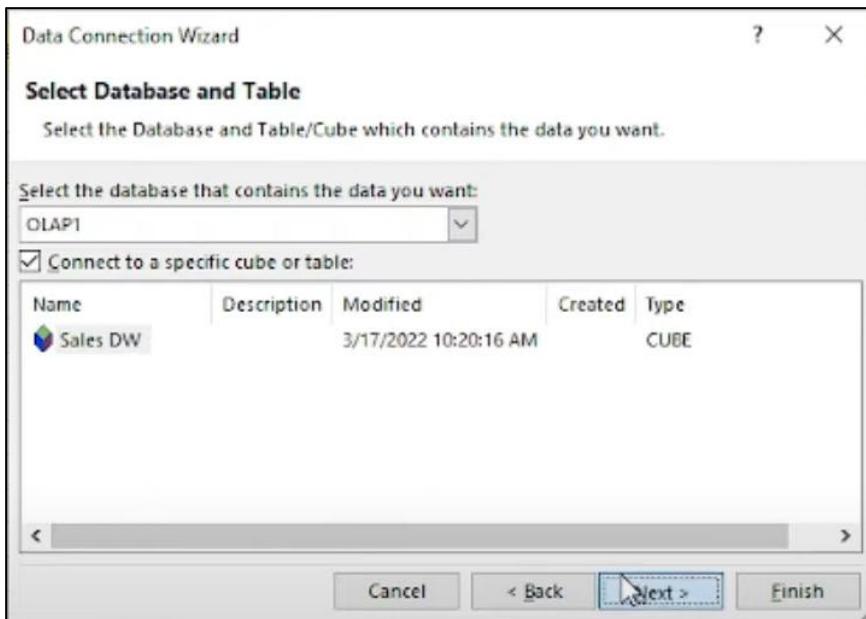

Go to Data tab → Get External Data From Other Sources → From Analysis Services

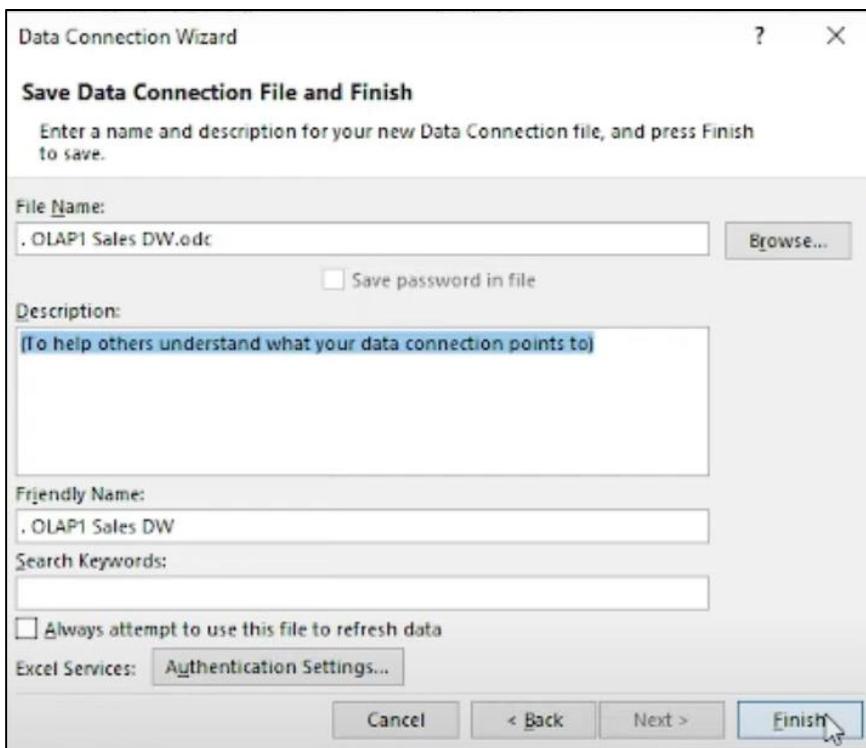

Step 2: Select Server name and Windows Authentication and click on Next

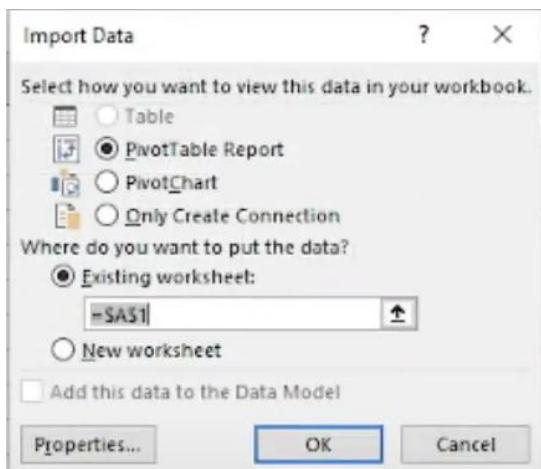

Step 3: Select OLAP (as per created before) click on Next

Step 4: Browse and select path name and click on Finish

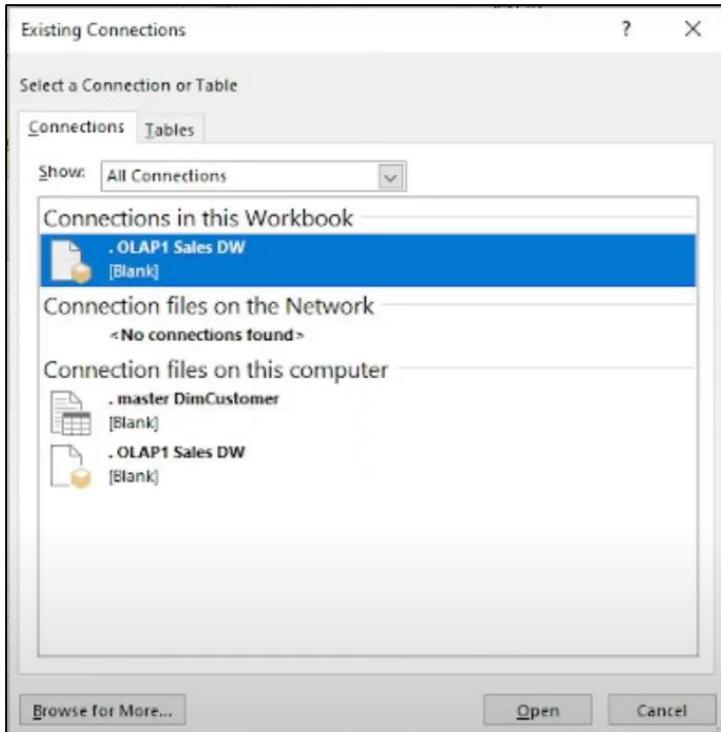

Step 5: Select PivotTableReport OK Import Data

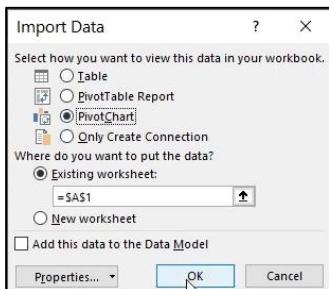

Step 6: Drag and Drop Fields in rows column and values

	A	B	C	D	E	F
1	Row Labels	Deviation	Quantity			
2						
3						
3	Arial Washing Powder 1kg	4	1			
4	Nirma Soap	9	6			
5	Rice Grains 1kg	4	3			
6	SunFlower Oil 1 ltr	6	4			
7	Wheat Floor 1kg	4	4			
8						
9						
9	Nirma Soap	12	6			
10	Rice Grains 1kg	1.5	1			
11	SunFlower Oil 1 ltr	3	2			
12	Wheat Floor 1kg	1	1			
13						
14						
14	Arial Washing Powder 1kg	8	2			
15	Nirma Soap	12	6			
16	Rice Grains 1kg	4	4			
17	SunFlower Oil 1 ltr	1.5	1			
18	Wheat Floor 1kg	2	2			
19	Grand Total	72	43			
20						

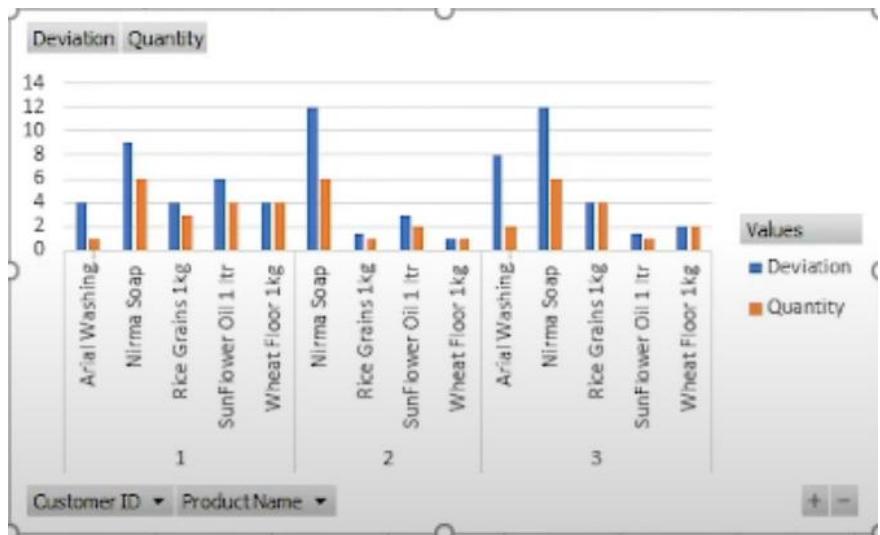

Step 7: Go to Data tab existing connections → Select existing connection OLAP Sales DW and click on Open

Step 8: Select PivotChart OK Import Data

Step 9: Click on OK

Practical No. 5

Aim: - Apply What if analysis for data visualization. Design and generate necessary reports based on the data warehouse data.

Goal Seek Method:

Step 1: Go to Data Tab → Select the What- if Analysis → click on goal seek

The figure consists of three vertically stacked screenshots of Microsoft Excel, illustrating the use of the Goal Seek feature.

Screenshot 1: Data Tab Selection

The screenshot shows the Excel ribbon with the "Data" tab selected. In the "Data Tools" group, the "What-If Analysis" button is highlighted, showing the "Goal Seek..." option in its dropdown menu.

Screenshot 2: Goal Seek Dialog Box

The screenshot shows a Goal Seek dialog box open over a spreadsheet. The dialog box has the following settings:

- Set cell:** E7
- To value:** 2000
- By changing cell:** \$E\$4

The spreadsheet contains the following data:

	B	C	D	E	F	G	H	I	J
1									
2									
3		Product	Book						
4		Quantity	10						
5		Price	110						
6		Total	1100						
7									
8									
9									
10									
11									
12									
13									

Screenshot 3: Goal Seek Status Confirmation

The screenshot shows a Goal Seek Status dialog box confirming a solution. The dialog box displays the following information:

- Goal Seeking with Cell E7 found a solution.
- Target value: 2000
- Current value: 2000

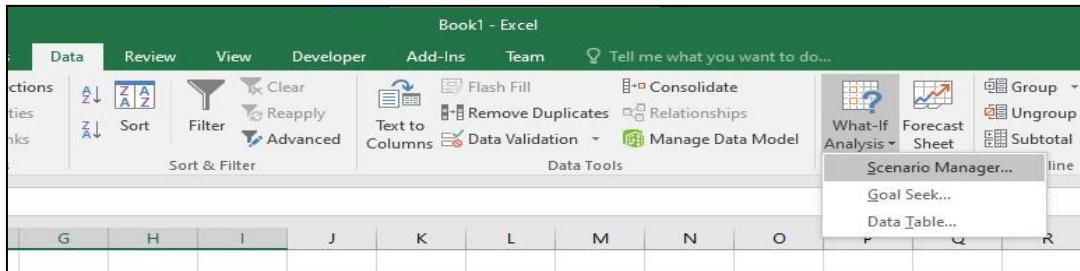

The dialog box has "OK" and "Cancel" buttons.

The spreadsheet data after the goal seek operation is as follows:

	B	C	D	E	F	G	H	I	J
1									
2									
3		Product	Book						
4		Quantity	18.18182	15					
5		Price	110	115					
6		Total	2000	1725					
7									
8									
9									
10									
11									
12									
13									

Scenario Manager Method

Step 1: Go to Data Tab → Select the What- if Analysis → click on Scenario Manager

Step 2: Add Scenario values and then click on ok.

A screenshot of an Excel spreadsheet titled 'Book1 - Excel'. The data is organized into a table with columns for Product, Book, Quantity, and Price. A 'Total' row provides summary values. An 'Add Scenario' dialog box is overlaid on the spreadsheet. It contains fields for 'Scenario name:' (set to 'ABC'), 'Changing cells:' (set to 'I4:I5'), a 'Comment:' text area (containing 'Created by Windows User on 1/4/2023'), and a 'Protection' section with a checked checkbox for 'Prevent changes'. The 'OK' button is visible at the bottom right of the dialog.

A screenshot of the same Excel spreadsheet from the previous step. The 'Scenario Values' dialog box is now open, prompting for values for the changing cells. It shows two entries: '1: \$I\$4 45' and '2: \$I\$5 500'. The 'OK' button is visible at the bottom right of the dialog.

Product Book

Quantity	18.18182	15	20	25	30
Price	110	115	120	150	120
Total	2000	2500	2400	3750	3600

Product Book

Quantity	18.18182	15	20	25	45
Price	110	115	120	150	500
Total	2000	2500	2400	3750	3600

Data Table Method

Product Book

Quantity	18.18182	15	20	25	45

Highest	60	50
Lowest	40	20
Total Price	3800	

Total Books	% Sold for highest price
100	60
	NO. of Books Unit Profit
	Highest 60 50
	Lowest 40 20
	Total Price 3800

Step1: In Excel, On the Data tab, in the Data tools group, click What-If Analysis

Step 2: Click on What –if-Analysis and select scenario manager.

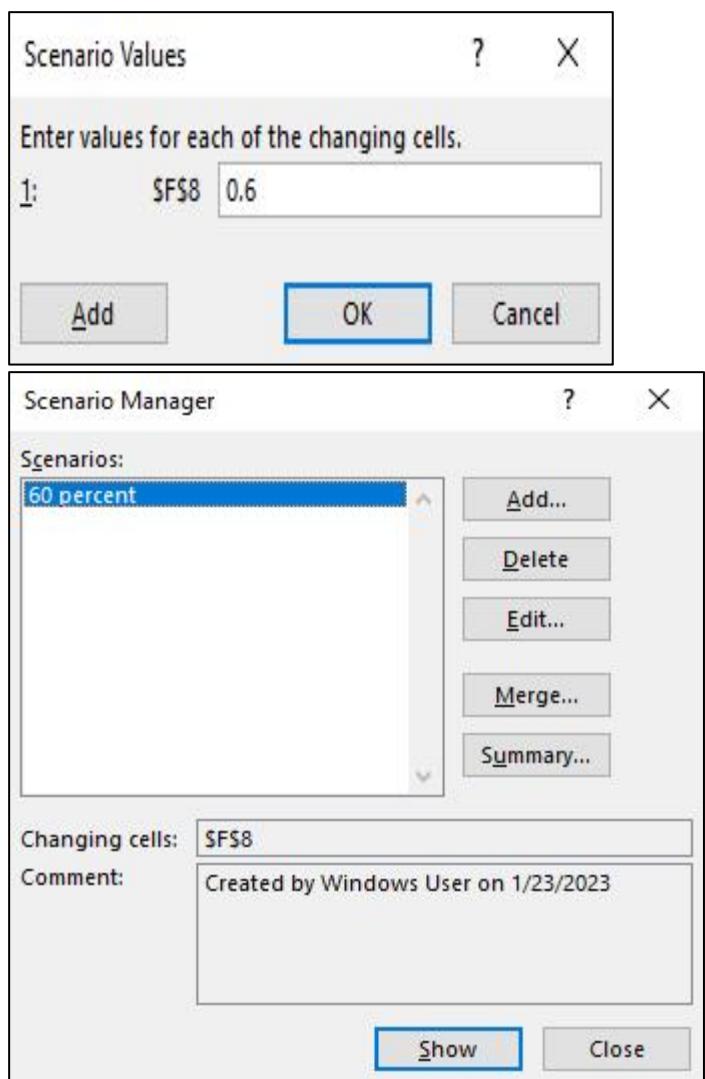

Step 3: Add a scenario by clicking on Add.

The Edit Scenario dialog box is open, showing:

- Scenario name: 60 percent
- Changing cells: \$F\$8
- Comment: Created by Windows User on 1/23/2023
- Protection: Prevent changes (checkbox checked)

Step 4: Enter the corresponding value 0.6 and click on OK again.

FINAL OUTPUT:

The screenshot shows a Microsoft Excel spreadsheet and the 'Scenario Manager' dialog box.

Worksheet Data:

Total Books	% Sold for highest price
100	60

	NO. of Books	Unit Profit
Highest	0.6	50
Lowest	40	20
Total Price	830	

Scenario Manager Dialog Box:

- Scenarios:** A list box containing "60 percent".
- Buttons:** Add..., Delete, Edit..., Merge..., Summary..., Show, Close.
- Changing cells:** \$F\$8
- Comment:** Created by Windows User on 1/23/2023

Practical No. 6

Aim: Perform data classification using classification algorithm.

Time series is a series of data points in which each data point is associated with a timestamp. A simple example is the price of a stock in the stock market at different points of time on a given day. Another example is the amount of rainfall in a region at different months of the year. R language uses many functions to create, manipulate and plot the time series data. The data for the time series is stored in an R object called time-series object. It is also a R data object like a vector or data frame.

The time series object is created by using the `ts()` function.

SYNTAX

The basic syntax for `ts()` function in time series analysis is –

```
timeseries.object.name <- ts(data, start, end, frequency)
```

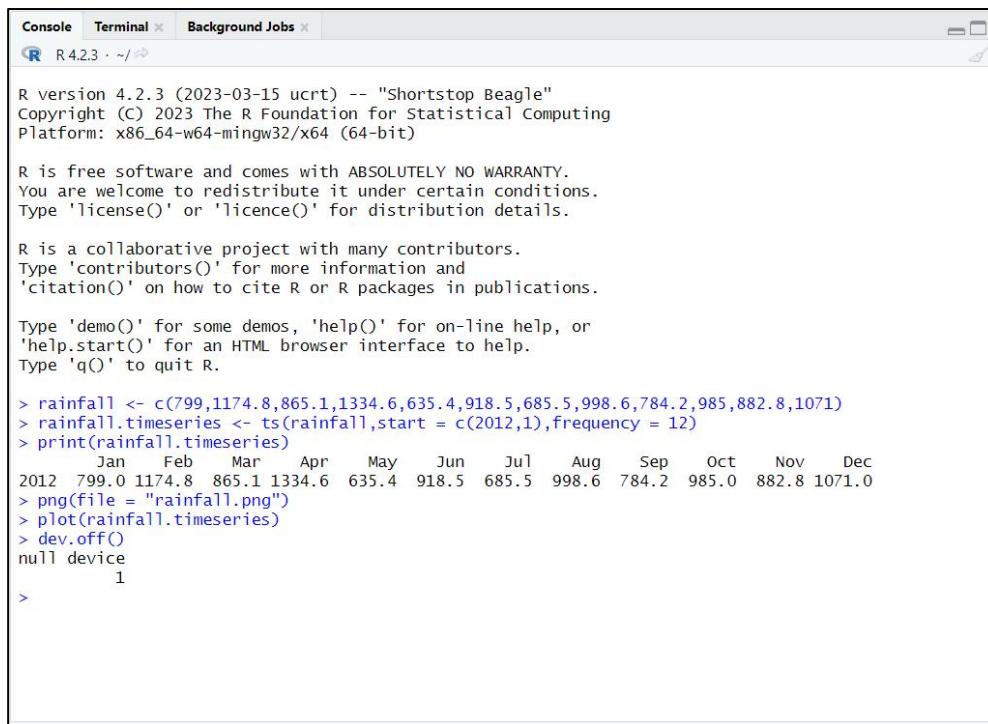

Following is the description of the parameters used –

- `data` is a vector or matrix containing the values used in the time series.
- `start` specifies the start time for the first observation in time series.
- `end` specifies the end time for the last observation in time series.
- `frequency` specifies the number of observations per unit time.

Except the parameter "data" all other parameters are optional.

Consider the annual rainfall details at a place starting from January 2012. We create an R time series object for a period of 12 months and plot it.

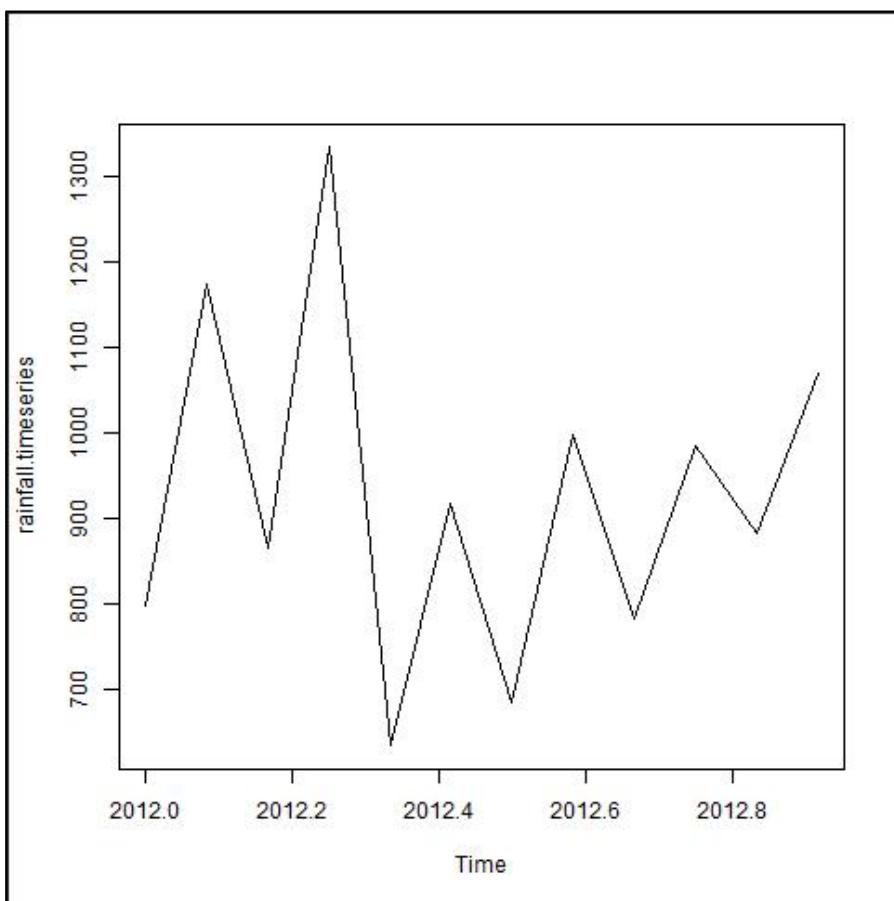

```
#Get the data points in form of a R vector.  
rainfall <- c(799,1174.8,865.1,1334.6,635.4,918.5,685.5,998.6,784.2,985,882.8,1071)  
  
#Convert it to a timeseries object  
rainfall.timeseries <- ts(rainfall,start = c(2012,1),frequency=12)  
  
#print the timeseries data  
print(rainfall.timeseries)  
  
#give the chart file a name  
png(file = "rainfall.png")  
  
#plot a graph of the time series  
plot(rainfall.timeseries)  
  
#save the file  
dev.off()
```

The screenshot shows an R console window with the following content:

Aim: -Perform Data clustering using clustering algorithm.

K Means Clustering in R Programming is an Unsupervised Non-linear algorithm that cluster data based on similarity or similar groups. It seeks to partition the observations into a pre-specified number of clusters. Segmentation of data takes place to assign each training example to a segment called a cluster. In the unsupervised algorithm, high reliance on raw data is given with large expenditure on manual review for review of relevance is given. It is used in a variety of fields like Banking, healthcare, retail, Media, etc.

Theory

K-Means clustering groups the data on similar groups. The algorithm is as follows:

- Choose the number K clusters.
- Select at random K points, the centroids(Not necessarily from the given data).
- Assign each data point to closest centroid that forms K clusters.
- Compute and place the new centroid of each centroid.
- Reassign each data point to new cluster.
- After final reassignment, name the cluster as Final cluster.

The Dataset

Iris dataset consists of 50 samples from each of 3 species of Iris(Iris setosa, Iris virginica, Iris versicolor) and a multivariate dataset introduced by British statistician and biologist Ronald Fisher in his 1936 paper The use of multiple measurements in taxonomic problems. Four features were measured from each sample i.e length and width of the sepals and petals and based on the combination of these four features, Fisher developed a linear discriminant model to distinguish the species from each other.

```
# Installing Packages  
install.packages("ClusterR")  
install.packages("cluster")  
  
# Loading package  
library(ClusterR)
```

```

library(cluster)

# Removing initial label of
# Species from original dataset
iris_1 <- iris[, -5]

# Fitting K-Means clustering Model
# to training dataset
set.seed(240) # Setting seed
kmeans.re <- kmeans(iris_1, centers = 3, nstart = 20)
kmeans.re

# Cluster identification for
# each observation
kmeans.re$cluster

# Confusion Matrix
cm <- table(iris$Species, kmeans.re$cluster)
cm

# Model Evaluation and visualization
plot(iris_1[c("Sepal.Length", "Sepal.Width")])
plot(iris_1[c("Sepal.Length", "Sepal.Width")]),
  col = kmeans.re$cluster)
plot(iris_1[c("Sepal.Length", "Sepal.Width")]),
  col = kmeans.re$cluster,
  main = "K-means with 3 clusters")

```

```

## Plotting cluster centers
kmeans.re$centers
kmeans.re$centers[, c("Sepal.Length", "Sepal.Width")]

# cex is font size, pch is symbol
points(kmeans.re$centers[, c("Sepal.Length", "Sepal.Width")],
       col = 1:3, pch = 8, cex = 3)

## Visualizing clusters
y_kmeans <- kmeans.re$cluster
clusplot(iris_1[, c("Sepal.Length", "Sepal.Width")],
          y_kmeans,

Practical No. 8

Aim: Perform the Linear regression on the given data warehouse data.

Regression analysis is a very widely used statistical tool to establish a relationship model between two variables. One of these variables is called predictor variable whose value is gathered through experiments. The other variable is called response variable whose value is derived from the predictor variable.

In Linear Regression these two variables are related through an equation, where exponent (power) of both these variables is 1. Mathematically a linear relationship represents a straight line when plotted as a graph. A non-linear relationship where the exponent of any variable is not equal to 1 creates a curve.

Following is the description of the parameters used –

- y is the response variable.
- x is the predictor variable.
- a and b are constants which are called the coefficients.

Steps to Establish a Regression

A simple example of regression is predicting weight of a person when his height is known. To do this we need to have the relationship between height and weight of a person.

The steps to create the relationship is –

- Carry out the experiment of gathering a sample of observed values of height and corresponding weight.
- Create a relationship model using the `lm()` functions in R.
- Find the coefficients from the model created and create the mathematical equation using these
- Get a summary of the relationship model to know the average error in prediction. Also called residuals.
- To predict the weight of new persons, use the `predict()` function in R.

Input Data

Below is the sample data representing the observations -

```
#Values of height
```

```
151, 174, 138, 186, 128, 136, 179, 163, 152, 131
```

```
#Values of weight.
```

```
63, 81, 56, 91, 47, 57, 76, 72, 62, 48
```

lm() Function:

This function creates the relationship model between the predictor and the response variable.

Syntax:

The basic syntax for lm() function in linear regression is-

```
lm(formula,data)
```

Following is the description of the parameters used: -

- formula is a symbol presenting the relation between x and
- data is the vector on which the formula will be applied.

A. Create Relationship Model & get the Coefficients

```
#Values of height
```

```
x<-c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)
```

```
#Values of width
```

```
y<-c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)
```

```
#Apply the lm() function.
```

```
relation <- lm(y~x)
```

```
print(relation)
```

Console Terminal Background Jobs

```
R 4.2.3 · ~/🔗
> x<-c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)
> y<-c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)
> relation <- lm(y~x)
> print(relation)

Call:
lm(formula = y ~ x)

Coefficients:
(Intercept)                  x
-38.4551                   0.6746

>
```

B. Get the Summary of the Relationship

```
# Values of height
x<-c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)

#Values of width
y<- c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)

#Apply the lm() function.

relation <- lm(y~x)

print(summary(relation))
```

```

predict() Function

Syntax

The basic syntax for predict() in linear regression is-

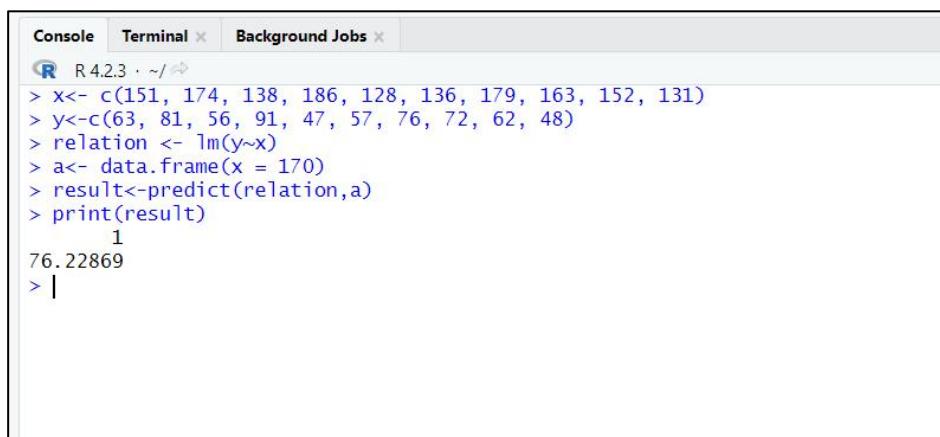

```
predict(object, newdata)
```

Following is the description of the parameters used-

- object is the formula which is already created using the lm() function.
- newdata is the vector containing the new value for predictor variable.

C. Predict the weight of new persons

```
#The predictor vector.  
x<- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)  
  
#The response vector.  
y<-c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)  
  
# Apply the lm() function.  
relation <- lm(y~x)  
  
#Find weight of a person with height 170.  
a<- data.frame(x = 170)  
  
result <- predict(relation,a)  
  
print(result)
```

A screenshot of an R console window. The title bar says "Console Terminal x Background Jobs x". The R logo icon is visible. The console area contains the following R code and its output:

```
R 4.2.3 · ~/ ◊  
> x<- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)  
> y<-c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)  
> relation <- lm(y~x)  
> a<- data.frame(x = 170)  
> result<-predict(relation,a)  
> print(result)  
1  
76.22869  
> |
```

D. Visualize the Regression Graphically

```

#Create the predictor and response variable.

x <- c(151, 174, 138, 186, 128, 136, 179, 163, 152, 131)

y <- c(63, 81, 56, 91, 47, 57, 76, 72, 62, 48)

relation <- lm(y~x)

#Give the chart file a name.

png(file="linearregression.png")

# Plot the chart

plot(y,x,col="blue",main = "Height & Weight Regression",
      abline(lm(x~y)),cex = 1.3,pch = 16,xlab = "Weight in Kg",ylab = "Height in cm")

# Save the file.

dev.off()

```

The screenshot shows the RStudio interface with the 'Console' tab selected. The console window displays the R code being run, starting with the creation of vectors x and y, followed by fitting a linear model relation, creating a plot with a regression line, and finally saving the plot. The R version shown is 4.2.3.

```

Output:

Practical No. 9

Aim: Perform the Logical regression on the given data warehouse data.

The Logistic Regression is a regression model in which the response variable (dependent variable) has categorical values such as True/False or 0/1. It actually measures the probability of a binary response as the value of response variable based on the mathematical equation relating it with the predictor variables.

The general mathematical equation for logistic regression is –

$$y = 1/(1+e^{-(a+b_1x_1+b_2x_2+b_3x_3+\dots)})$$

Following is the description of the parameters used –

- y is the response variable.
- x is the predictor variable.
- a and b are the coefficients which are numeric constants.

The function used to create the regression model is the `glm()` function.

Syntax:

The basic syntax for `glm()` function in logistic regression is –

```
#glm(formula,data,family)
```

Following is the description of the parameters used –

- `formula` is the symbol presenting the relationship between the variables.
- `data` is the data set giving the values of these variables.
- `family` is R object to specify the details of the model. Its value is `binomial` for logistic regression.

The in-built data set "mtcars" describes different models of a car with their various engine specifications. In "mtcars" data set, the transmission mode (automatic or manual) is described by the column `am` which is a binary value (0 or 1). We can create a logistic regression model between the columns "`am`" and 3 other columns - `hp`, `wt` and `cyl`.

```

Select some columns from mtcars.

```
input <- mtcars[,c("am","cyl","hp","wt")]
print(head(input))
```

When we execute the above code, it produces the following result –

Console Terminal × Background Jobs ×

R 4.2.3 · ~/ ↗

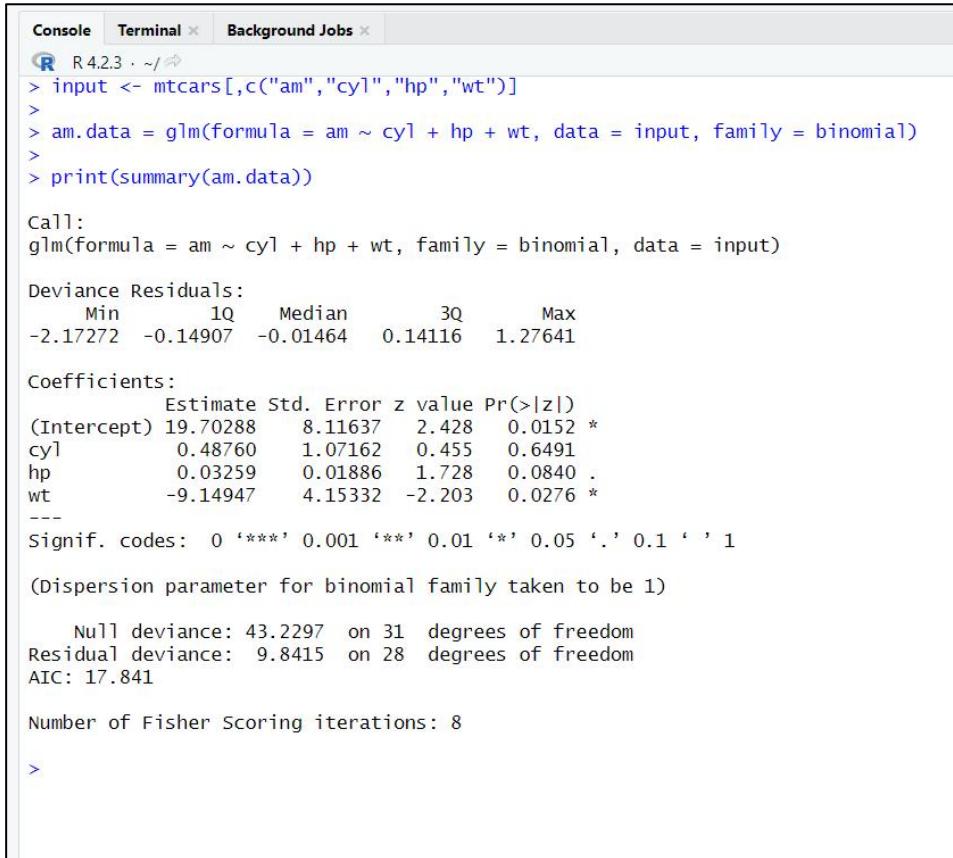

```
> input <- mtcars[,c("am","cyl","hp","wt")]
>
> print(head(input))
      am cyl hp wt
Mazda RX4    1   6 110 2.620
Mazda RX4 Wag 1   6 110 2.875
Datsun 710   1   4  93 2.320
Hornet 4 Drive 0   6 110 3.215
Hornet Sportabout 0   8 175 3.440
Valiant      0   6 105 3.460
> |
```

Create Regression Model

We use the `glm()` function to create the regression model and get its summary for analysis.

```
input <- mtcars[,c("am","cyl","hp","wt")]
am.data = glm(formula = am ~ cyl + hp + wt, data = input, family = binomial)
print(summary(am.data))
```

When we execute the above code, it produces the following result –

The screenshot shows the R console interface with tabs for 'Console', 'Terminal', and 'Background Jobs'. The console window displays the R code and its output. The output includes:

- Call: `glm(formula = am ~ cyl + hp + wt, family = binomial, data = input)`
- Deviance Residuals:

Min	1Q	Median	3Q	Max
-2.17272	-0.14907	-0.01464	0.14116	1.27641

- Coefficients:

	Estimate	Std. Error	z value	Pr(> z)
(Intercept)	19.70288	8.11637	2.428	0.0152 *
cyl	0.48760	1.07162	0.455	0.6491
hp	0.03259	0.01886	1.728	0.0840 .
wt	-9.14947	4.15332	-2.203	0.0276 *

- Signif. codes: 0 ‘***’ 0.001 ‘**’ 0.01 ‘*’ 0.05 ‘.’ 0.1 ‘ ’ 1
- (Dispersion parameter for binomial family taken to be 1)
- Null deviance: 43.2297 on 31 degrees of freedom
- Residual deviance: 9.8415 on 28 degrees of freedom
- AIC: 17.841
- Number of Fisher Scoring iterations: 8

Conclusion:

In the summary as the p-value in the last column is more than 0.05 for the variables "cyl" and "hp", we consider them to be insignificant in contributing to the value of the variable "am". Only weight (wt) impacts the "am" value in this regression model.
